Lexicography in the Crystal Ball: Facts, Trends and Outlook

Gilles-Maurice de Schryver

*Dept of Languages and Cultures, Ghent
University (Belgium) &*

*Xhosa Dept, University of the Western
Cape, Cape Town (South Africa)*

1. THE EURALEX CONGRESSES CRYSTALLIZE

From milestone to milestone

- Half a century ago ‘a small group of linguists and lexicographers met at [Indiana University](#) to discuss a variety of problems related to the making of dictionaries’ (Householder 1962: v).
- The proceedings of that conference ([Householder & Saporta 1962](#)) set in motion the emergence of lexicography as a modern scientific discipline.

From milestone to milestone

- A decade later, Ladislav Zgusta's *Manual of Lexicography* (1971) gave every aspiring lexicographer something solid to hold onto.
- And have we held onto it: Zgusta's **magnum opus** remains one of the most cited works of our field.

From milestone to milestone

- Another decade later, another milestone.
- The year is 1983, when Reinhard Hartmann organizes a major international conference on lexicography in Exeter — baptized LEXeter '83 — where the basis is inter alia laid for:
- the international encyclopaedia of lexicography *Wörterbücher / Dictionaries / Dictionnaires* (published a decade later, in three massive volumes),

From milestone to milestone

- the book series *Lexicographica. Series Maior* (which started appearing in 1984) as well as
- the journal *Lexicographica. International Annual for Lexicography* (as of 1985), and last but not least,
- where the *European Association for Lexicography* itself — EURALEX — was established (cf. Hartmann 2008).

From milestone to milestone

- The LEXeter '83 proceedings (Hartmann 1984) thereby automatically became the proceedings of the **first EURALEX** congress.
- The **second EURALEX** congress was organized in 1986, with the proceedings appearing two years later (Snell-Hornby 1988).
- **From then on**, EURALEX has gathered biennially, with proceedings appearing two years after the event for the third and fourth congress, and simultaneously with the event as of the fifth congress onwards.

EURALEX CONGRESS				EURALEX PROCEEDINGS			
No.	Year	City	Country	Acronym	Editor(s)	Year	Publisher
1	1983	Exeter	UK	LEXeter '83	Hartmann	1984	Max Niemeyer Verlag

15	2012	Oslo	Norway	EURALEX OSLO 2012	Fjeld & Torjusen	2012	Universitetet i Oslo

Aim of the present paper

- Although the EURALEX board went on to launch the quarterly *International Journal of Lexicography* in 1988, the material published in the biennial EURALEX proceedings held its own over the years.
- The body of research reported on in the EURALEX proceedings is now so substantial that an in-depth analysis is in order. This is exactly the aim of the present paper.
- The study is driven by the data in the proceedings.

2. THE EURALEX METADATA DATABASE

Setting up for meta-analysis

- A **corpus** was built containing *all* the material found in all fourteen proceedings published so far, as well as *all* the material (bar the current paper) accepted for presentation at the fifteenth congress.
- In the corpus **each paper** (and each piece of editorial material) is **a separate file** with a unique identifier.
- A **separate database** contains all the **metadata** for each file.

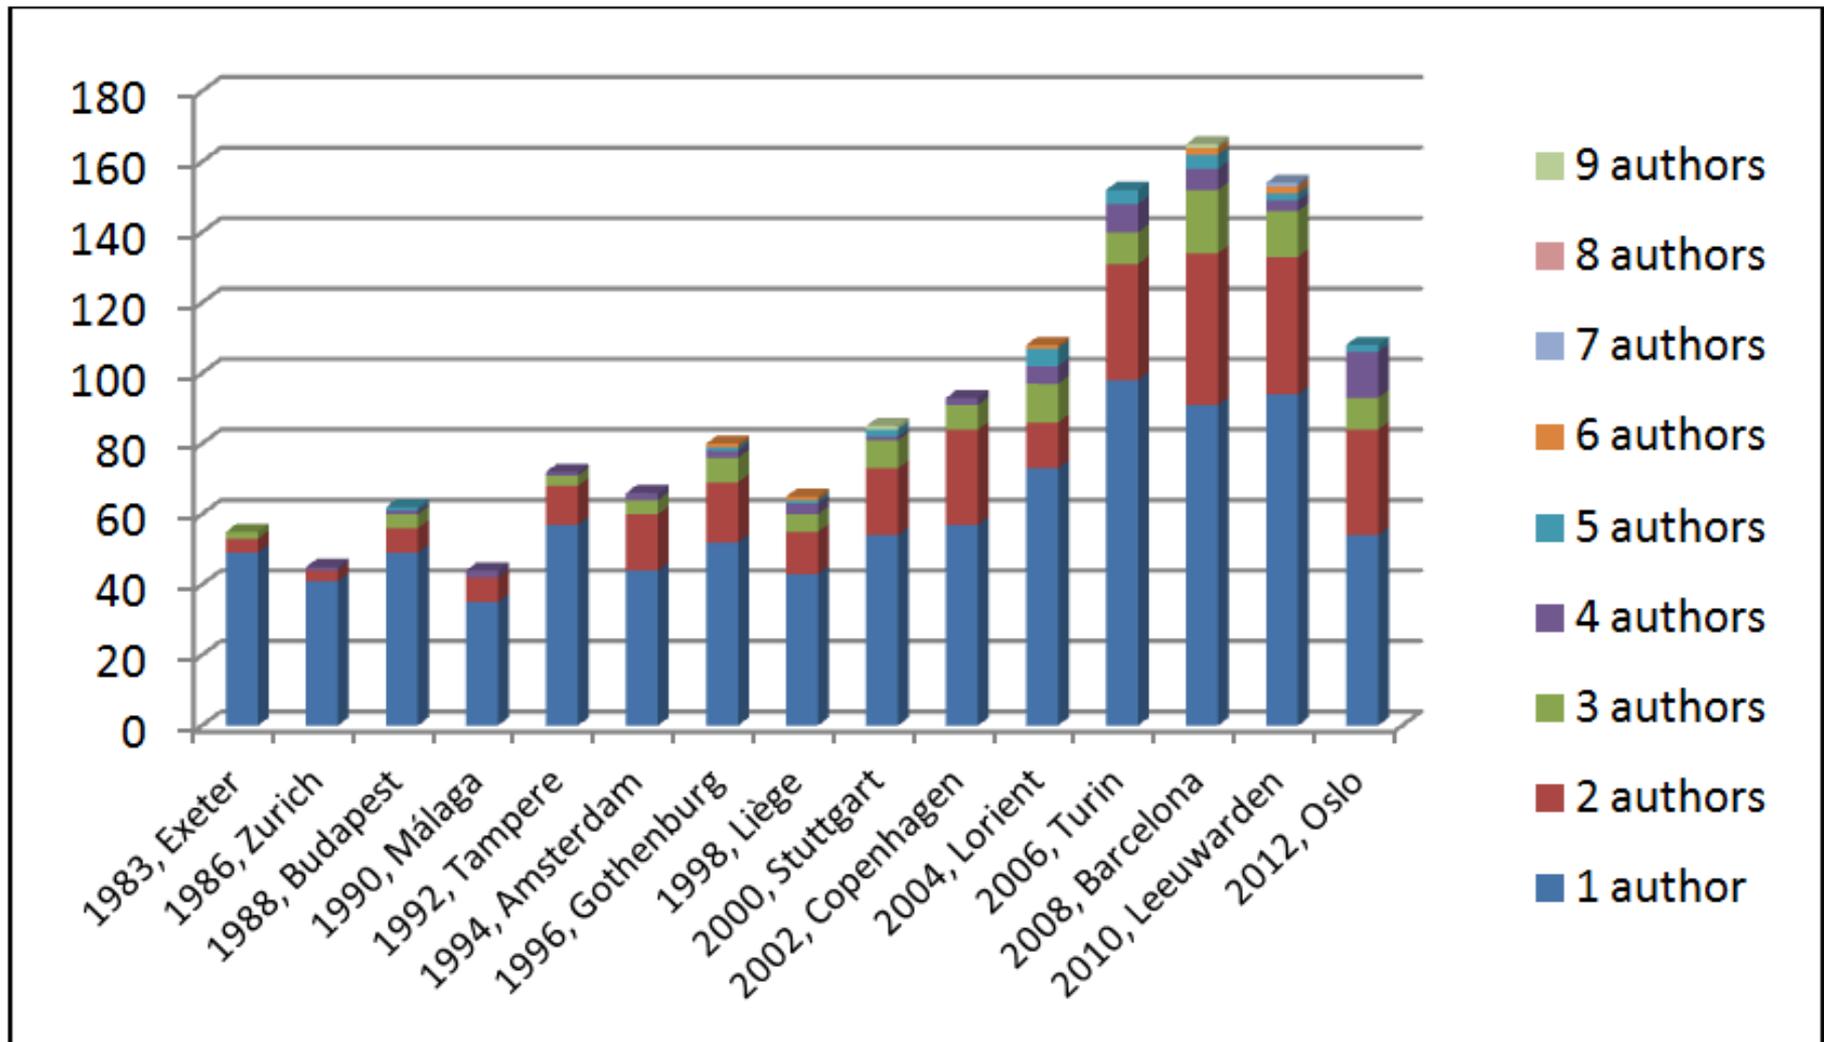

Setting up for meta-analysis

- The first four **proceedings** having been produced after the congresses took place, they do not necessarily contain all that was presented.
- Conversely, the proceedings of the next eleven congresses — the so-called **preceedings** — do contain a few papers which were not presented in the end.

Setting up for meta-analysis

- Overall, however, the proceedings represent the congresses well, even though one should keep in mind that **more activities** are typically taking place at the congresses themselves, which may include:
 - workshops,
 - symposia,
 - round tables,
 - structured debates,
 - poster and demo session, etc.
- Not to forget the publisher booths and the social programme.

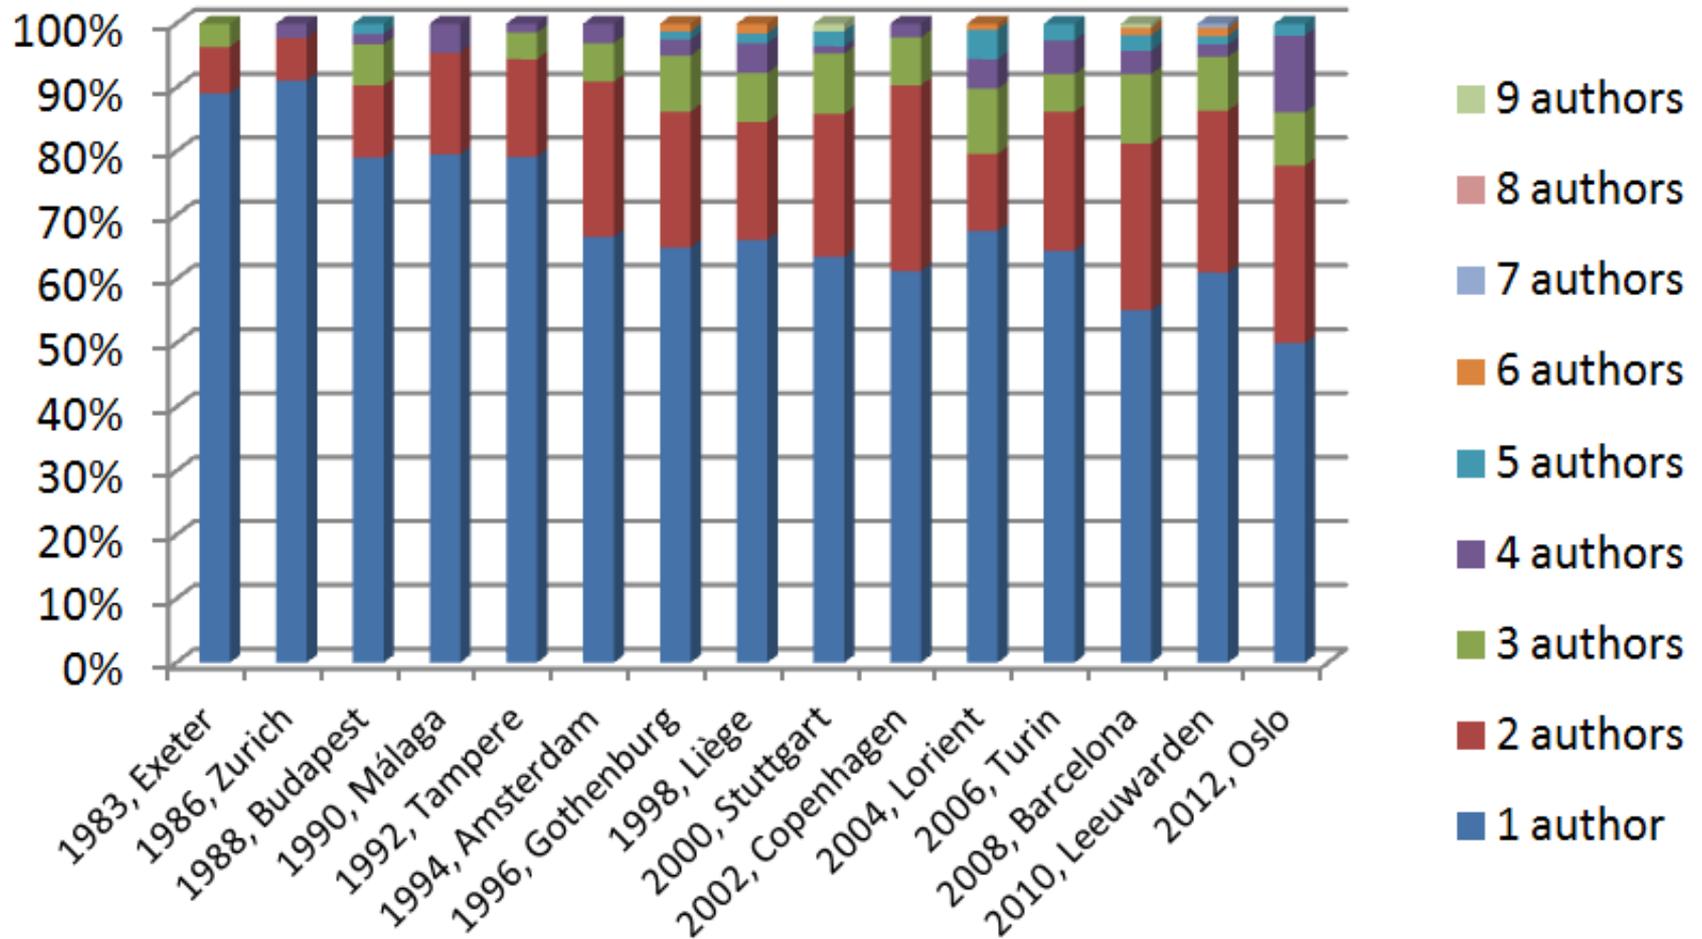

Papers per congress, showing number of authors per paper

Discussion ...

- The **number of papers grew exponentially** over the years, up to and including the 2008 congress, after which the number went down again, likely to a more manageable number.
- In total, a massive **1 354 papers** have been written so far.

Papers per congress, with number of authors per paper in %

Discussion ...

- The number of **single-authored papers** is **steadily declining**; in 2012 descending below the 50% level for the first time.
- The **number of co-authors** per paper indeed **tends to grow** with each new congress.
- One dares suggest that lexicography is becoming **ever more complex**, needing the input of more than one scholar, and especially the input from **multiple disciplines**.

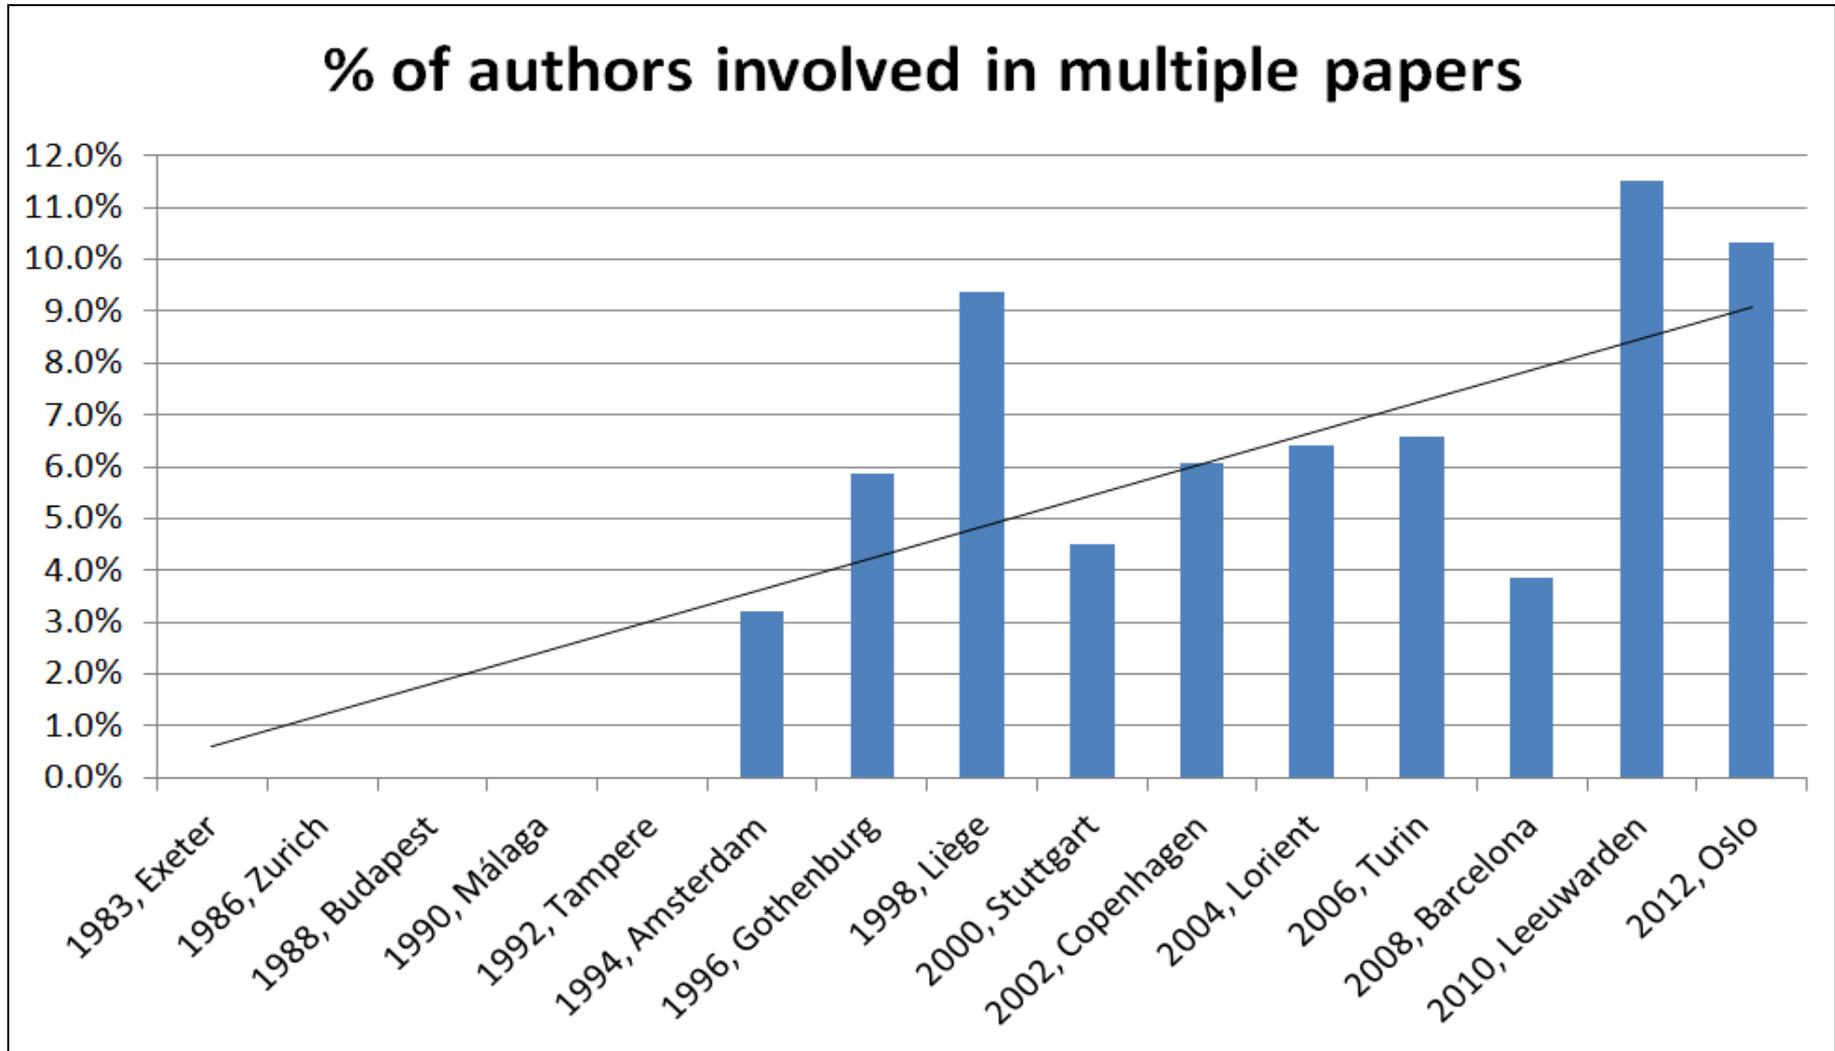

Average number of authors per paper at each congress

Discussion ...

- Overall, there are **2 130 authors** for the 1 354 papers written so far.
- The **number of authors per paper** rose — nearly linearly — from an average of about **1.1 three decades ago**, to about **1.9 today**.
- The average number of authors per paper **nearly doubled**.

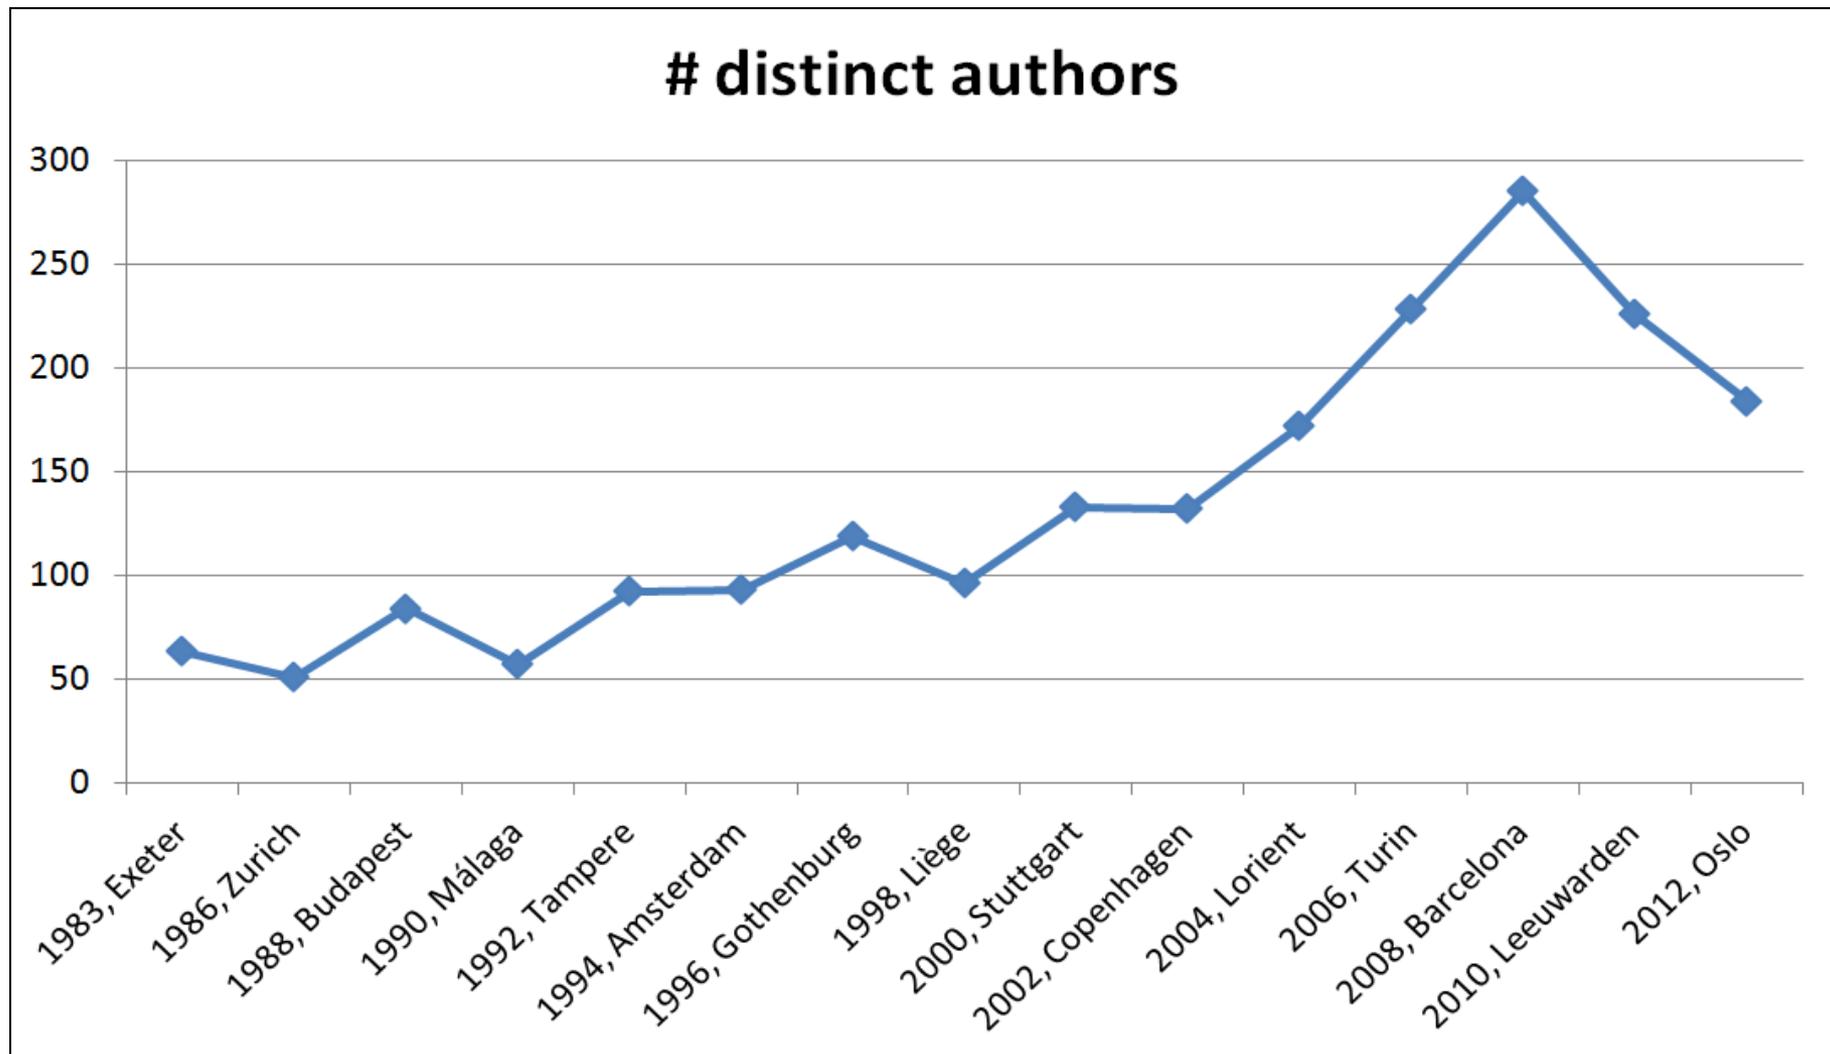

% of authors involved in multiple papers at each congress

Discussion ...

- The number of scholars who are involved in **multiple papers** at the same congress is **on the rise**.
- This phenomenon that **started in 1994**, where **about 3%** of the presenters were involved in multiple papers, a figure which has risen to **over 10% today**.

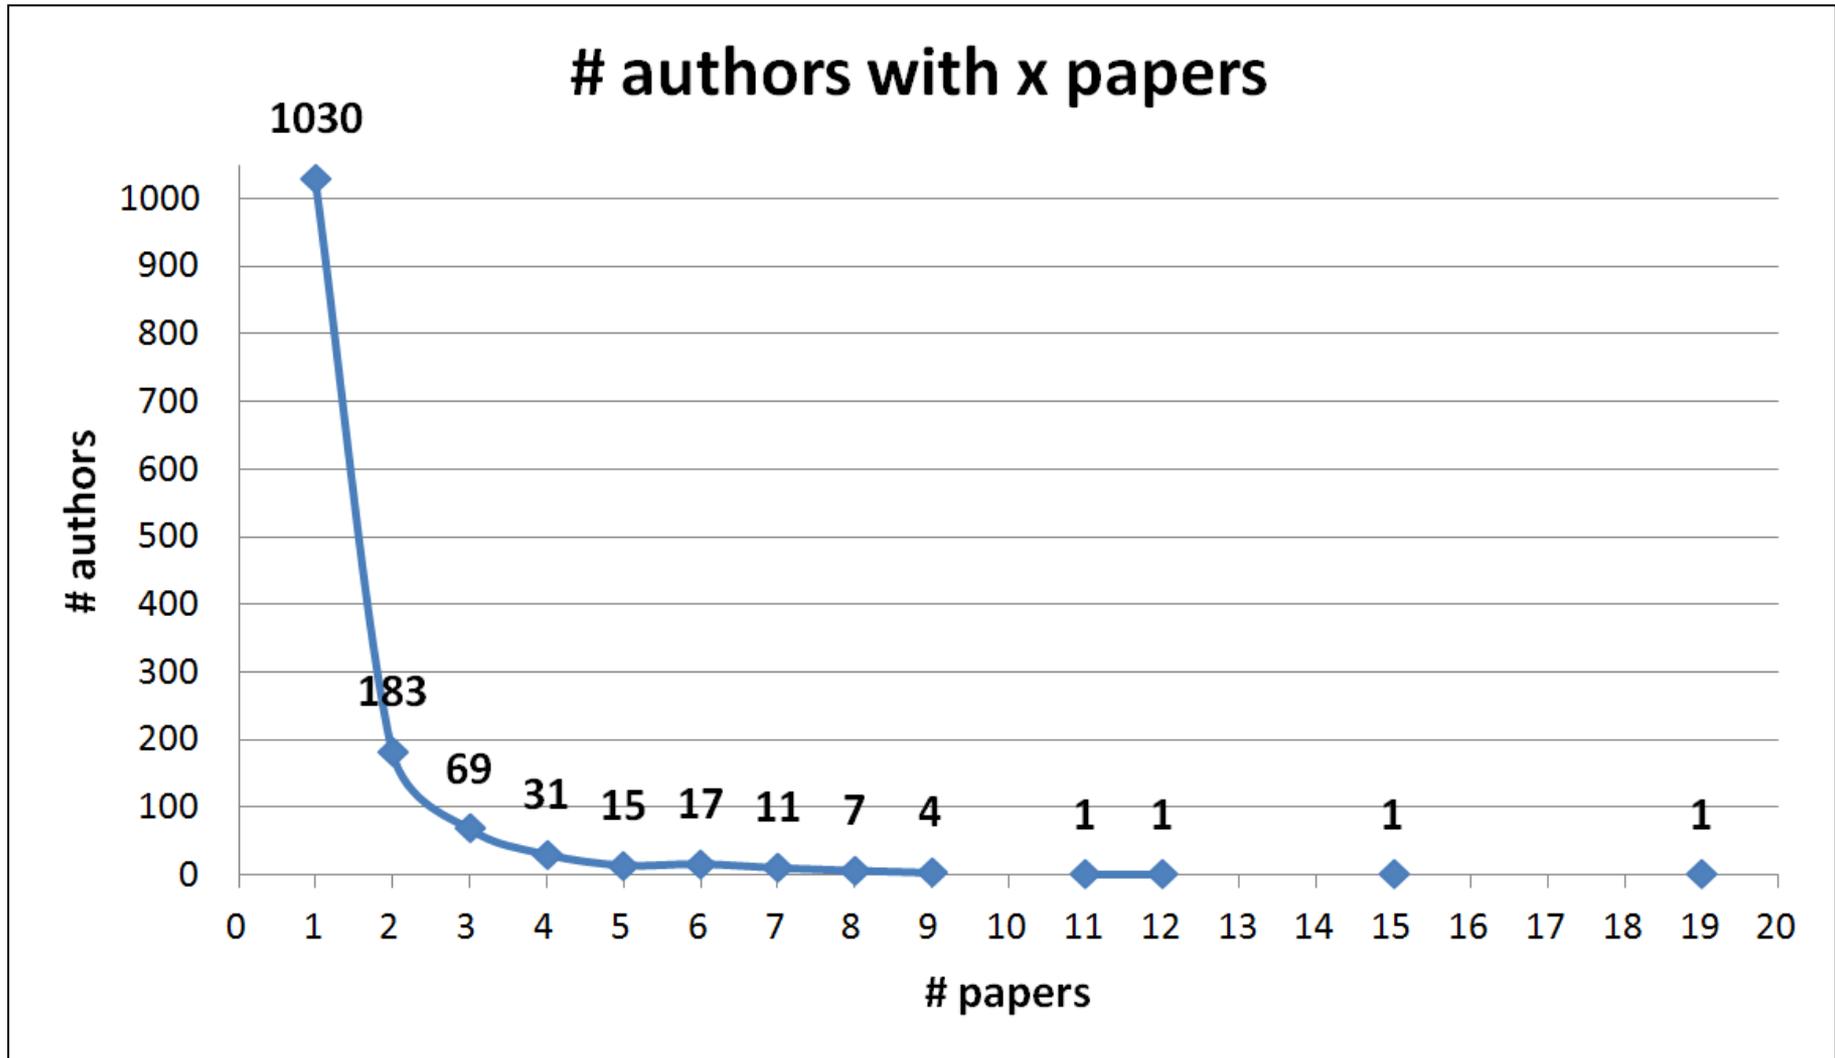

Number of distinct (i.e. unique) authors at each congress

Discussion ...

- Given that ever more scholars co-write (and co-present) papers, the **actual number of distinct (i.e. unique) authors** is thus lower than 2 130.
- Over the years, this metric went from about **50 (in 1983)** to **nearly 300 (in 2008)**, and is now back at **about 200 authors (in 2012)**.
- Still an impressive number.

Number of authors with x papers, across all congresses

Discussion ...

- **Loyal** (and even very loyal) **colleagues** do join in with papers time and again.
- A study of all authors, across all fifteen congresses, reveals that a grand total of **1 371 distinct scholars** have written papers for EURALEX over the the past three decades.
- The **distribution** is clearly **Zipfian**.

Author returns across the various congresses (with > 7 papers)

Author	Papers	1983	1986	1988	1990	1992	1994	1996	1998	2000	2002	2004	2006	2008	2010	2012

Varantola, Krista	7					1	1		2	1		2				

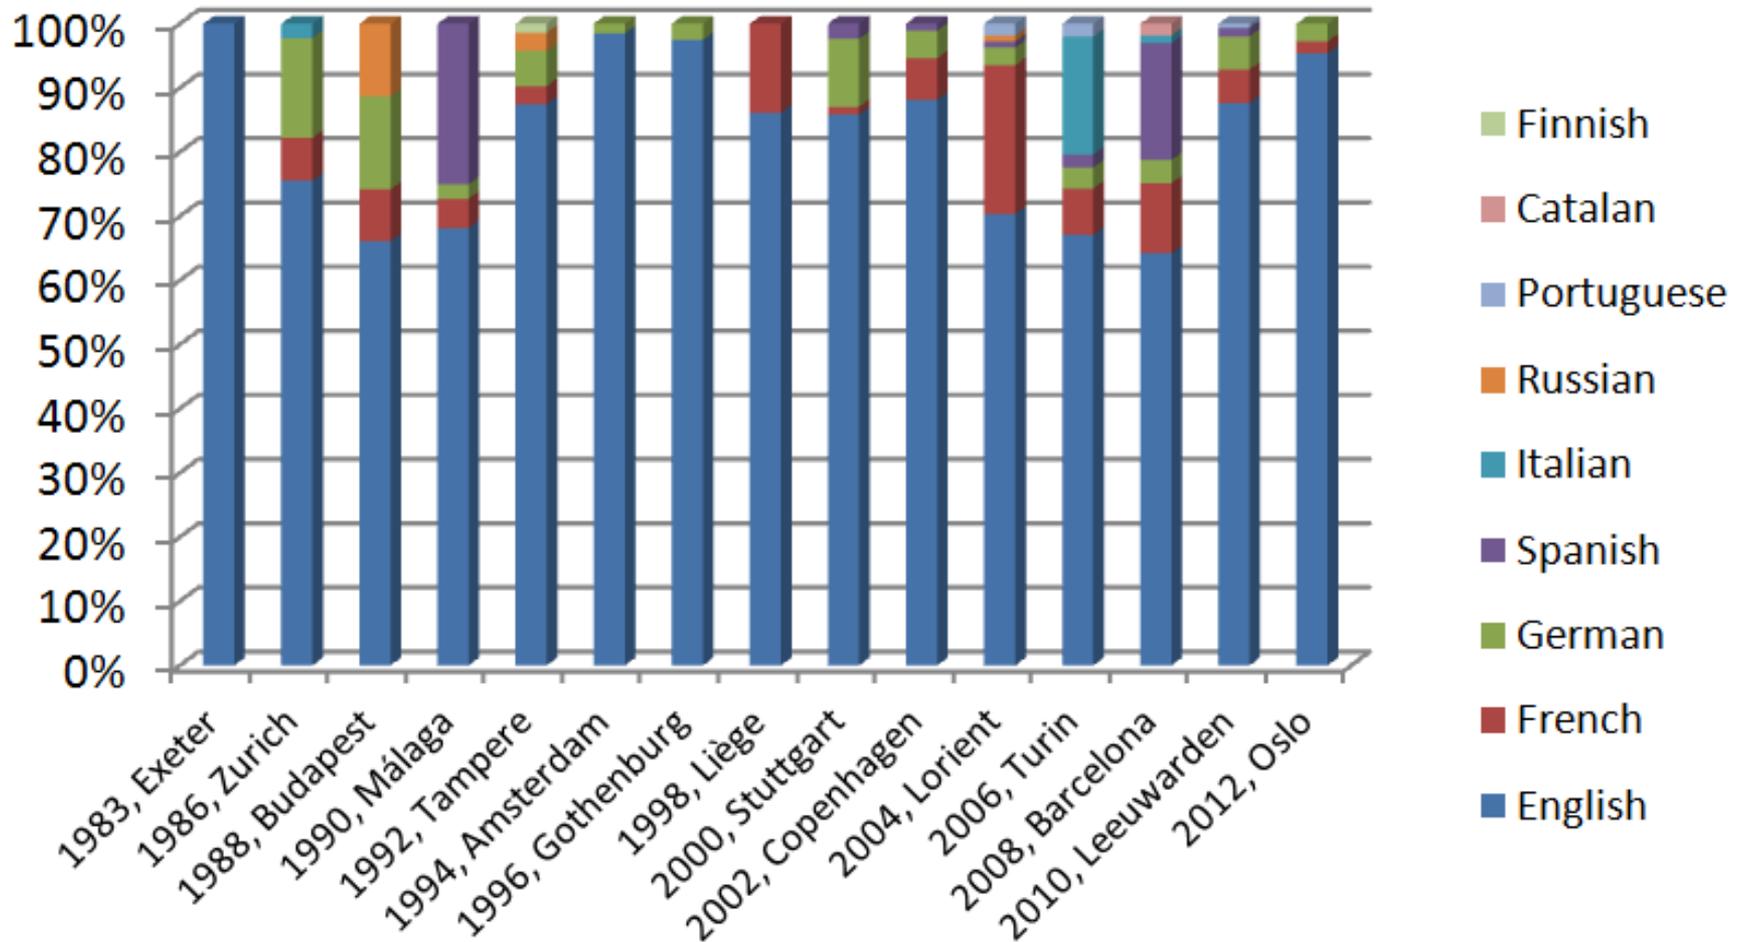

Top 4 author returns across the various congresses

Discussion ...

- To the insider, it will of course not really come as a surprise to see that **Ulrich Heid, Adam Kilgarriff, Patrick Hanks** and **Thierry Fontenelle** top this list.
- Each of them has become synonymous with **major developments** in the field at large, and it is gratifying to see their devotion to EURALEX.
- All other scholars listed in Table 2 are most certainly **'must-reads'** as well.

Languages of papers, in % per congress

Discussion ...

- **Nine languages** have been used for the 1 354 papers to date:
 - 1 099 in English (81.2%),
 - 92 in French (6.8%),
 - 62 in German (4.6%),
 - 50 in Spanish (3.7%),
 - 31 in Italian (2.3%),
 - 10 in Russian (0.7%),
 - 6 in Portuguese (0.4%),
 - 3 in Catalan (0.2%), and
 - a single one in Finnish (0.1%).

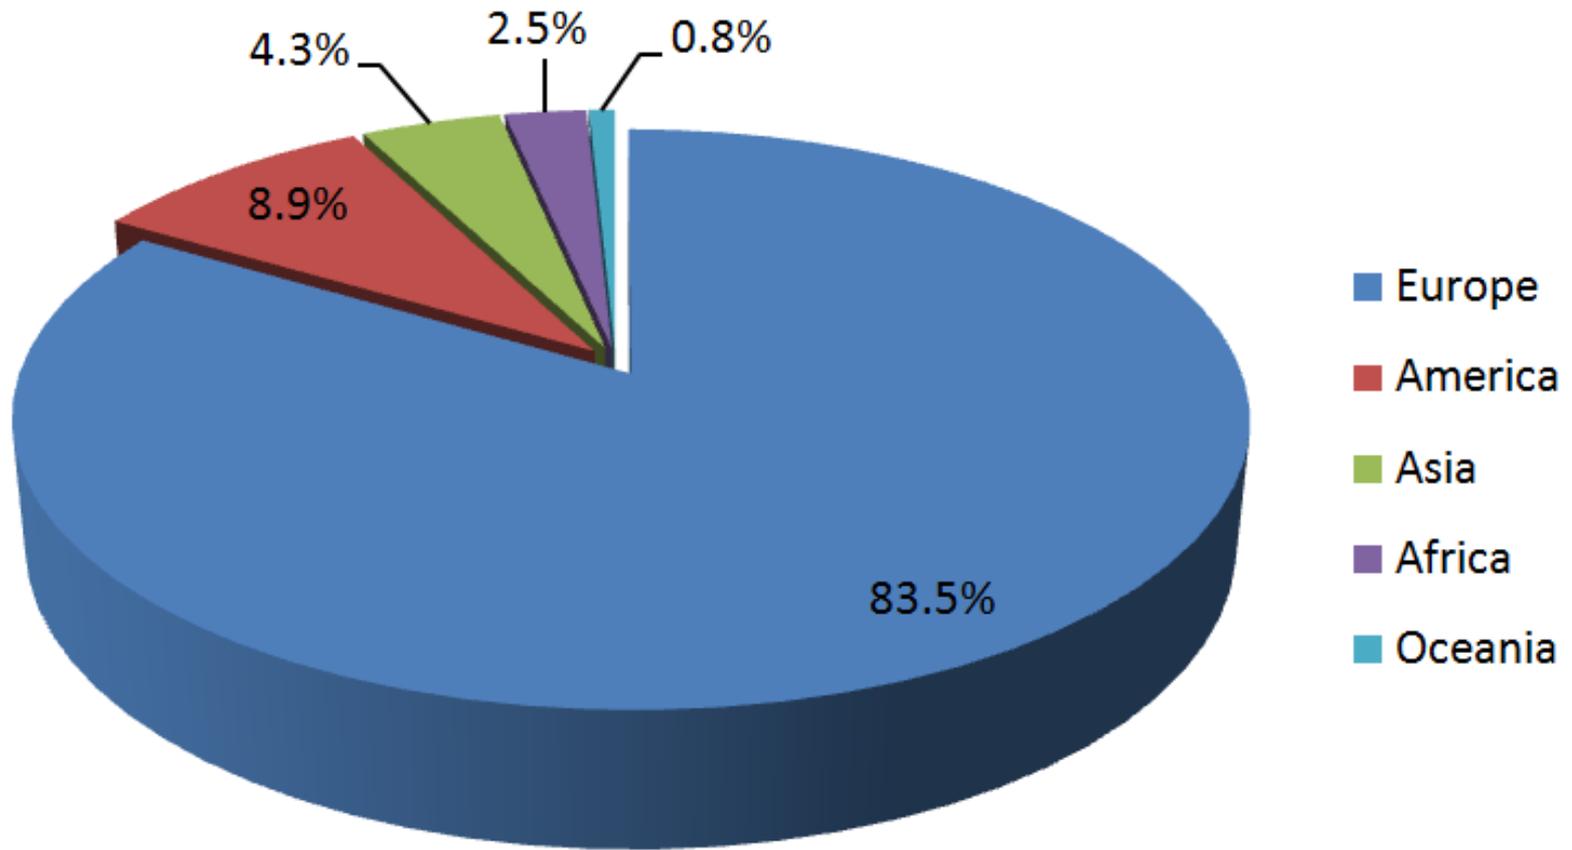

Discussion ...

- EURALEX congresses clearly seem to act as a magnet for local researchers, turning EURALEX congresses in **combined international and national gatherings** as they move around the continent.

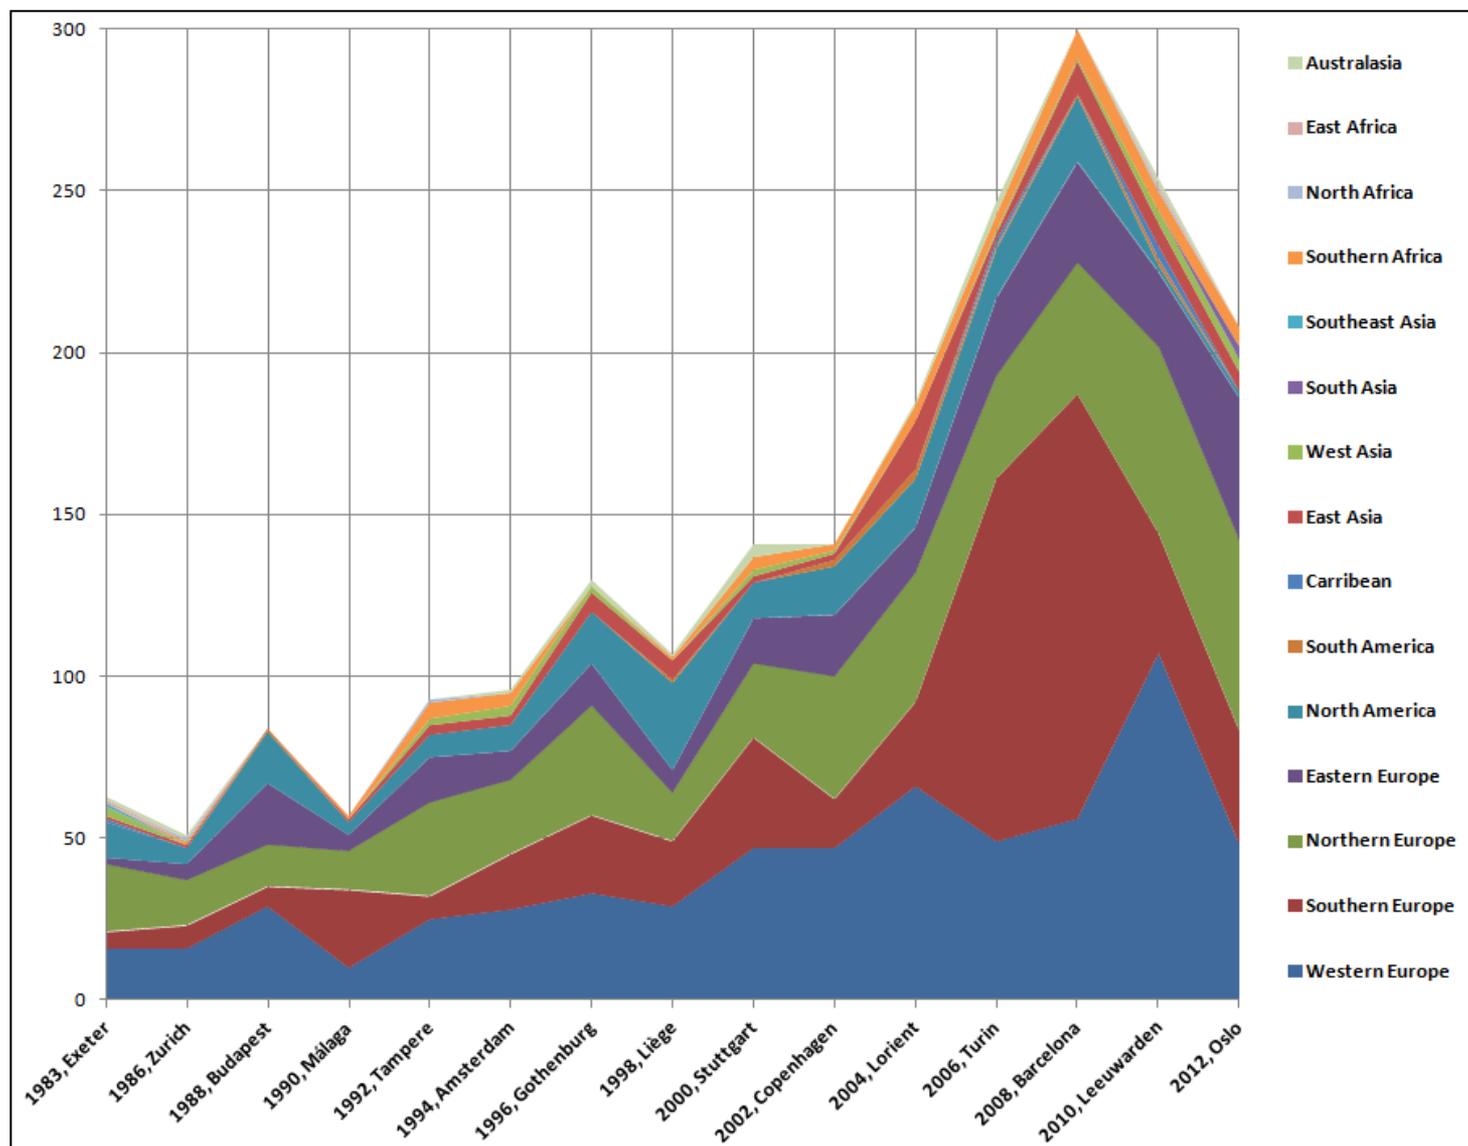

Country distribution of the affiliations for all authors

Region	Sub-region	Country	Papers	%
Europe	Southern Europe	Spain	222	10.29%
Europe	Southern Europe	Italy	199	9.23%

Europe	Northern Europe	Estonia	24	1.11%

Region distribution of the affiliations for all authors

Sub-region contribution per congress

3. THE EURALEX CITATION DATABASE

Setting up for citation analysis

- Not all papers make a lasting **impact**.
- Those that do, typically attract a number of **citations** over the years.
- Although this is not a substitute for inherent quality — after all, one can theoretically also and only refer to a paper merely to point out its infelicities — high citation counts typically correspond to **satisfaction**.

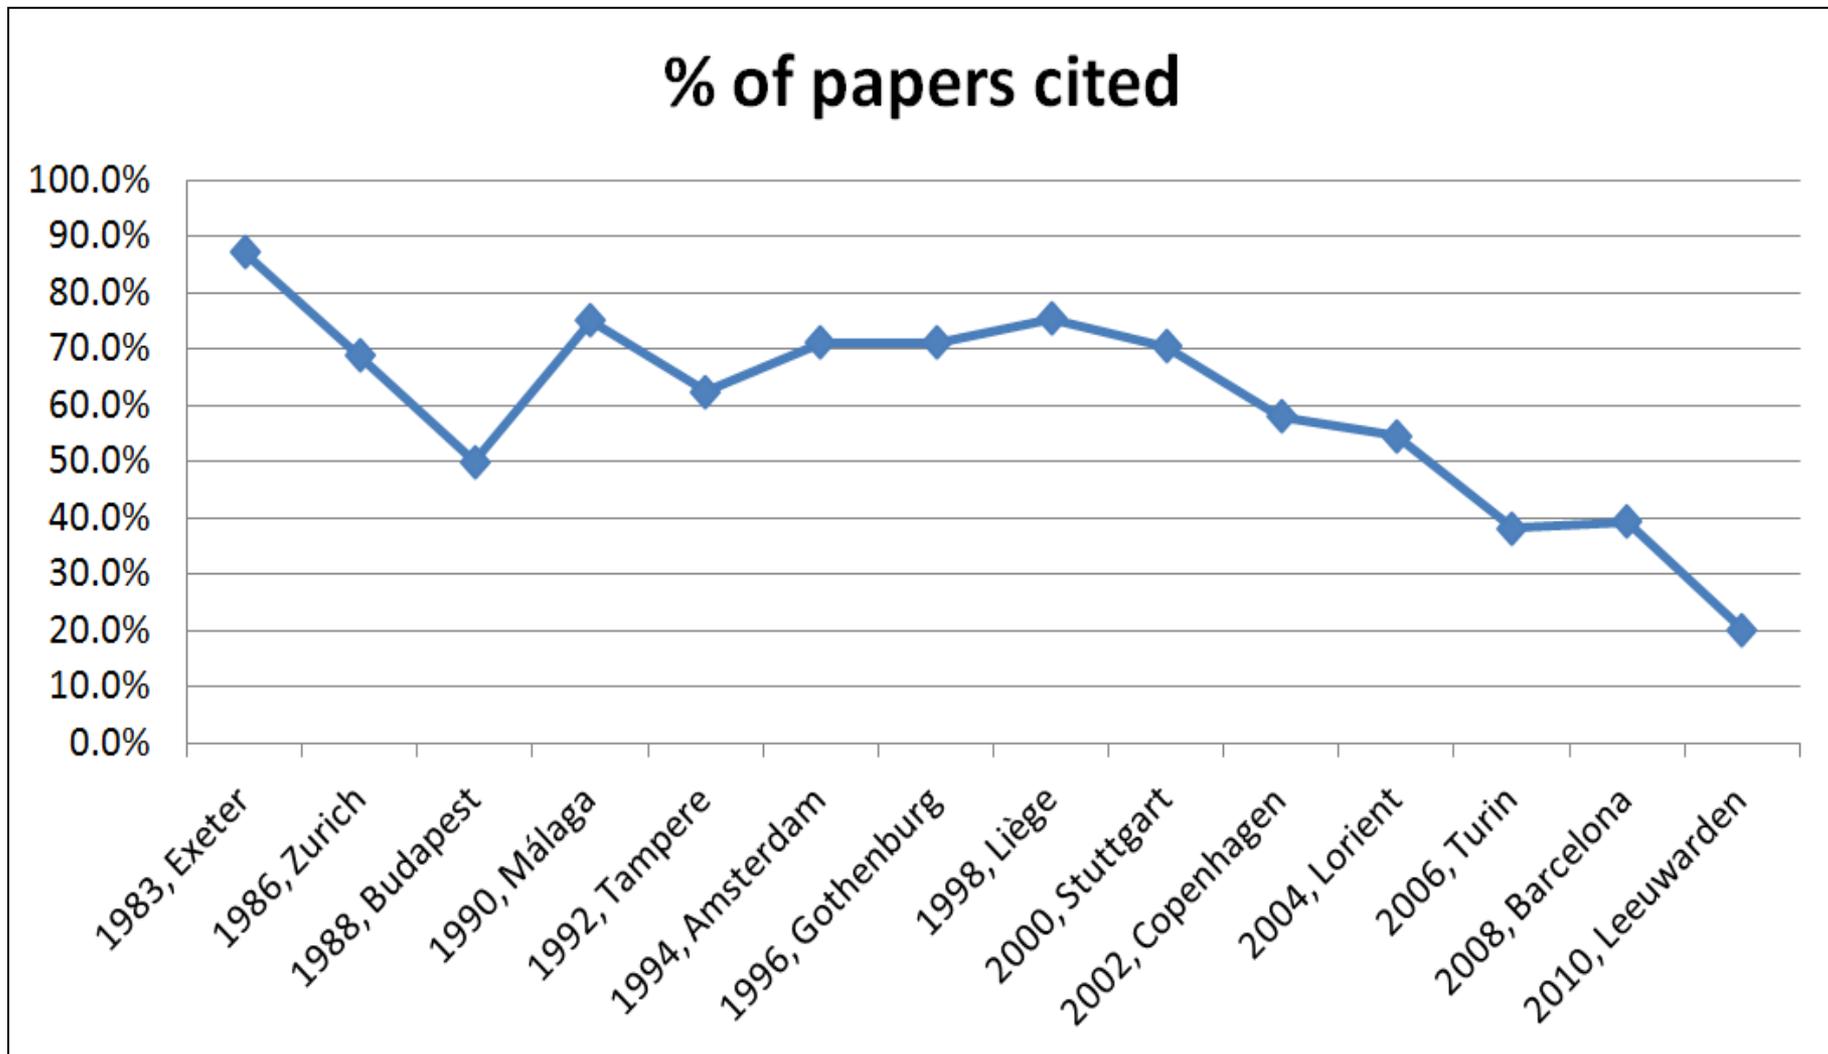

Setting up for citation analysis

- Today, the most convenient way to determine a paper's citations is simply to query [Google Scholar](#).
- In what follows, the citation status in Google Scholar as reflected on [24 July 2012](#) is used.
- The Google Scholar database does *not* see everything (yet), so all values are [minimum values](#).

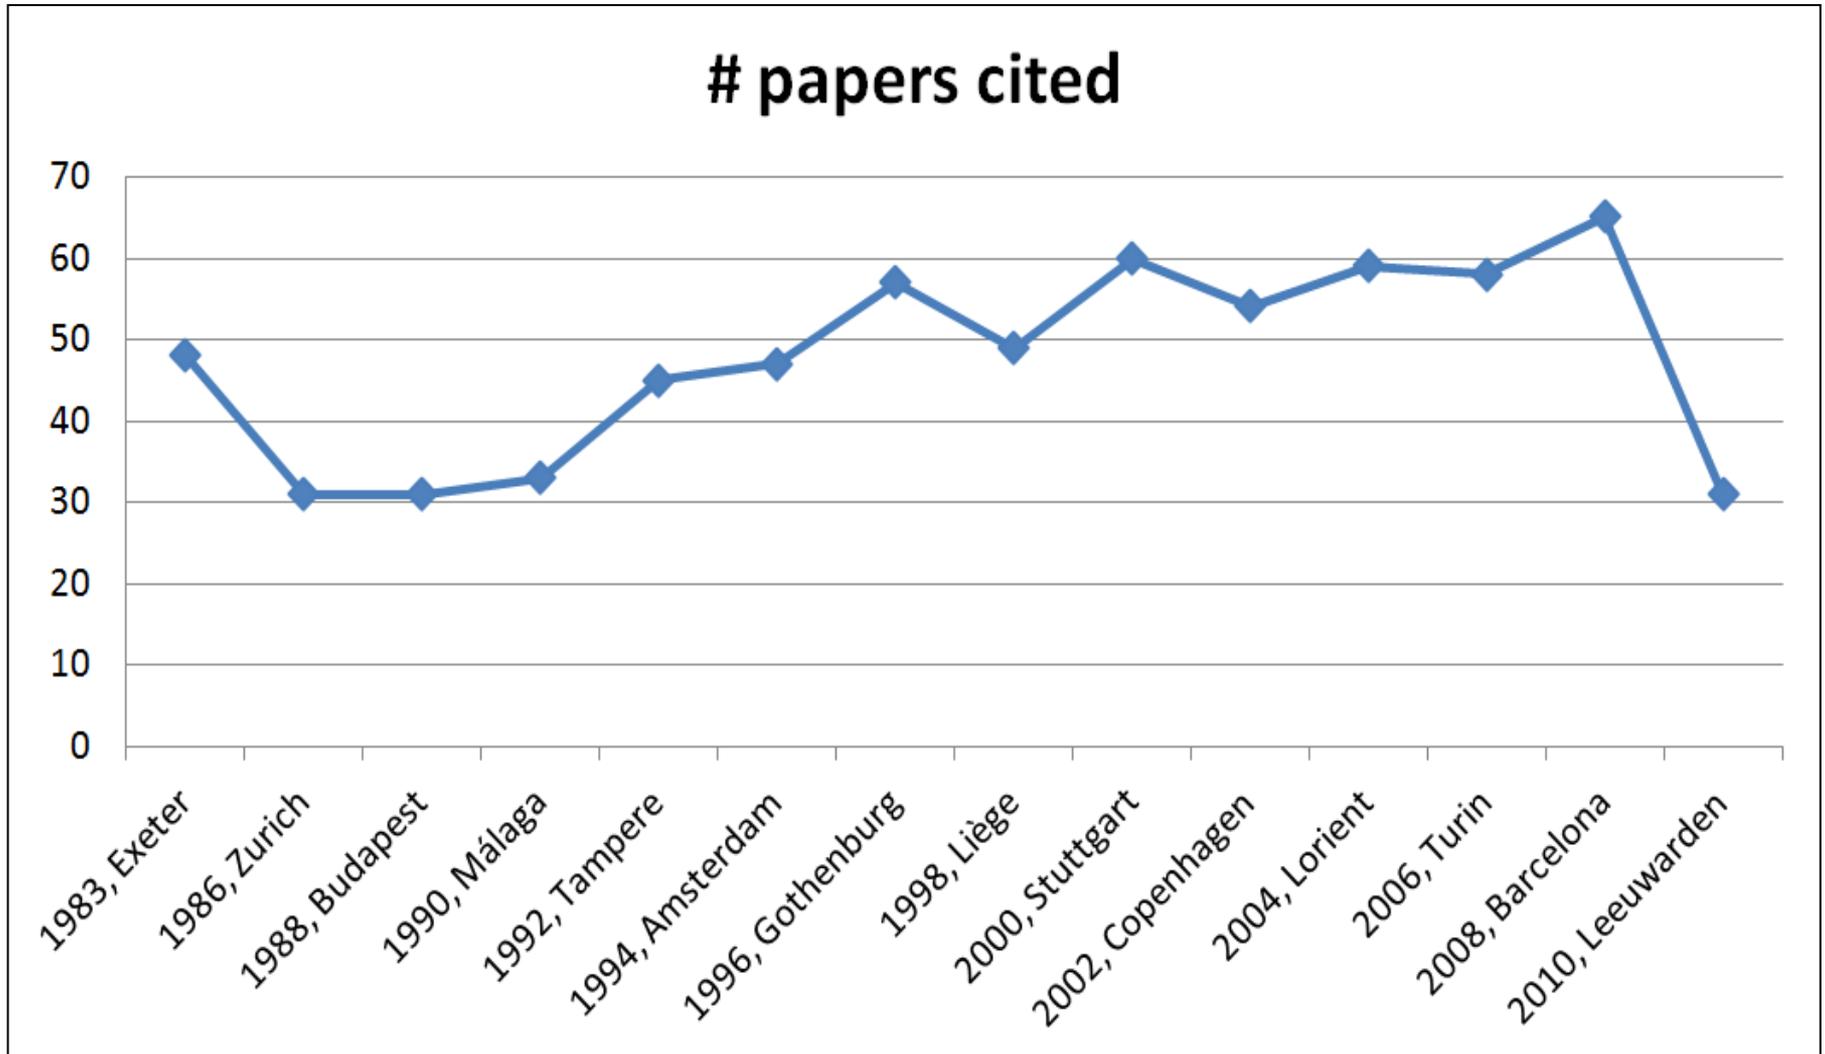

Setting up for citation analysis

- Given a congress paper first has to be published this section of the study looks at all the papers from the **first fourteen congresses** only.
- In all, there are **1 246 papers** for this period.
- 668 (or thus **53.6%**) have been **cited at least once**.

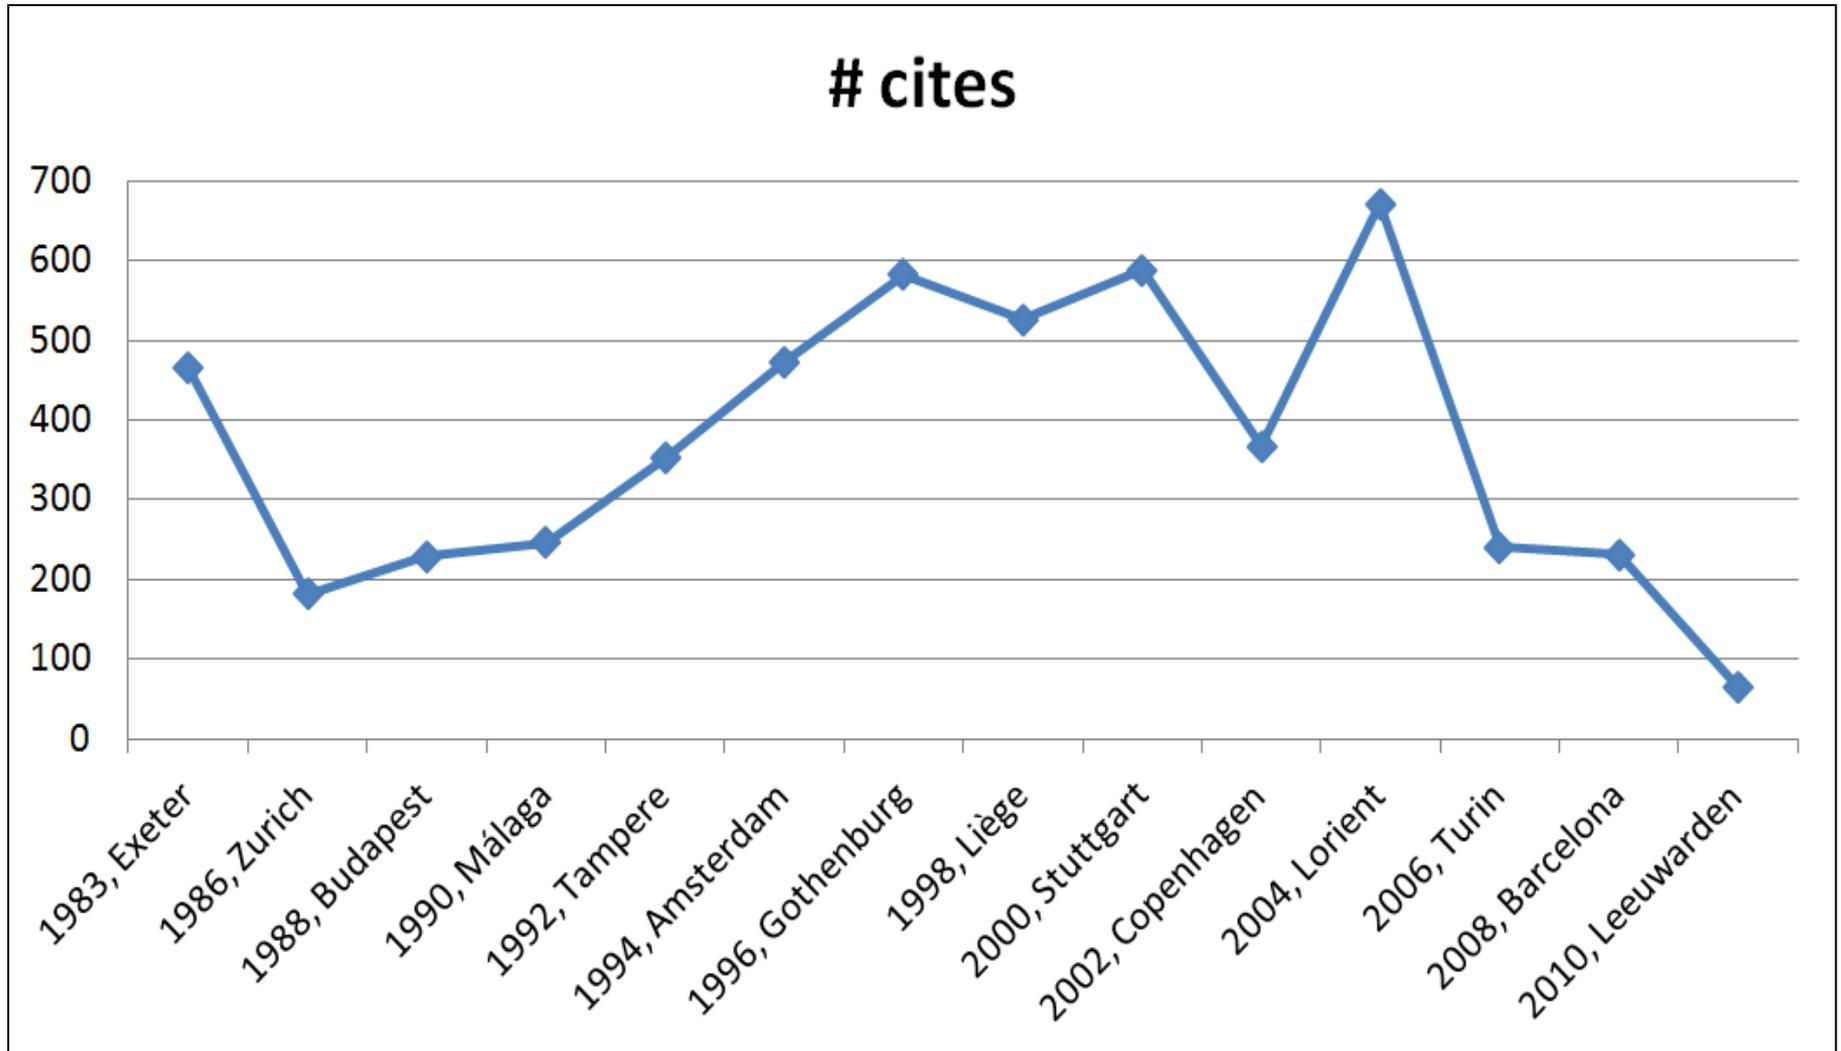

Percent of papers cited, per congress

Number of papers cited, per congress

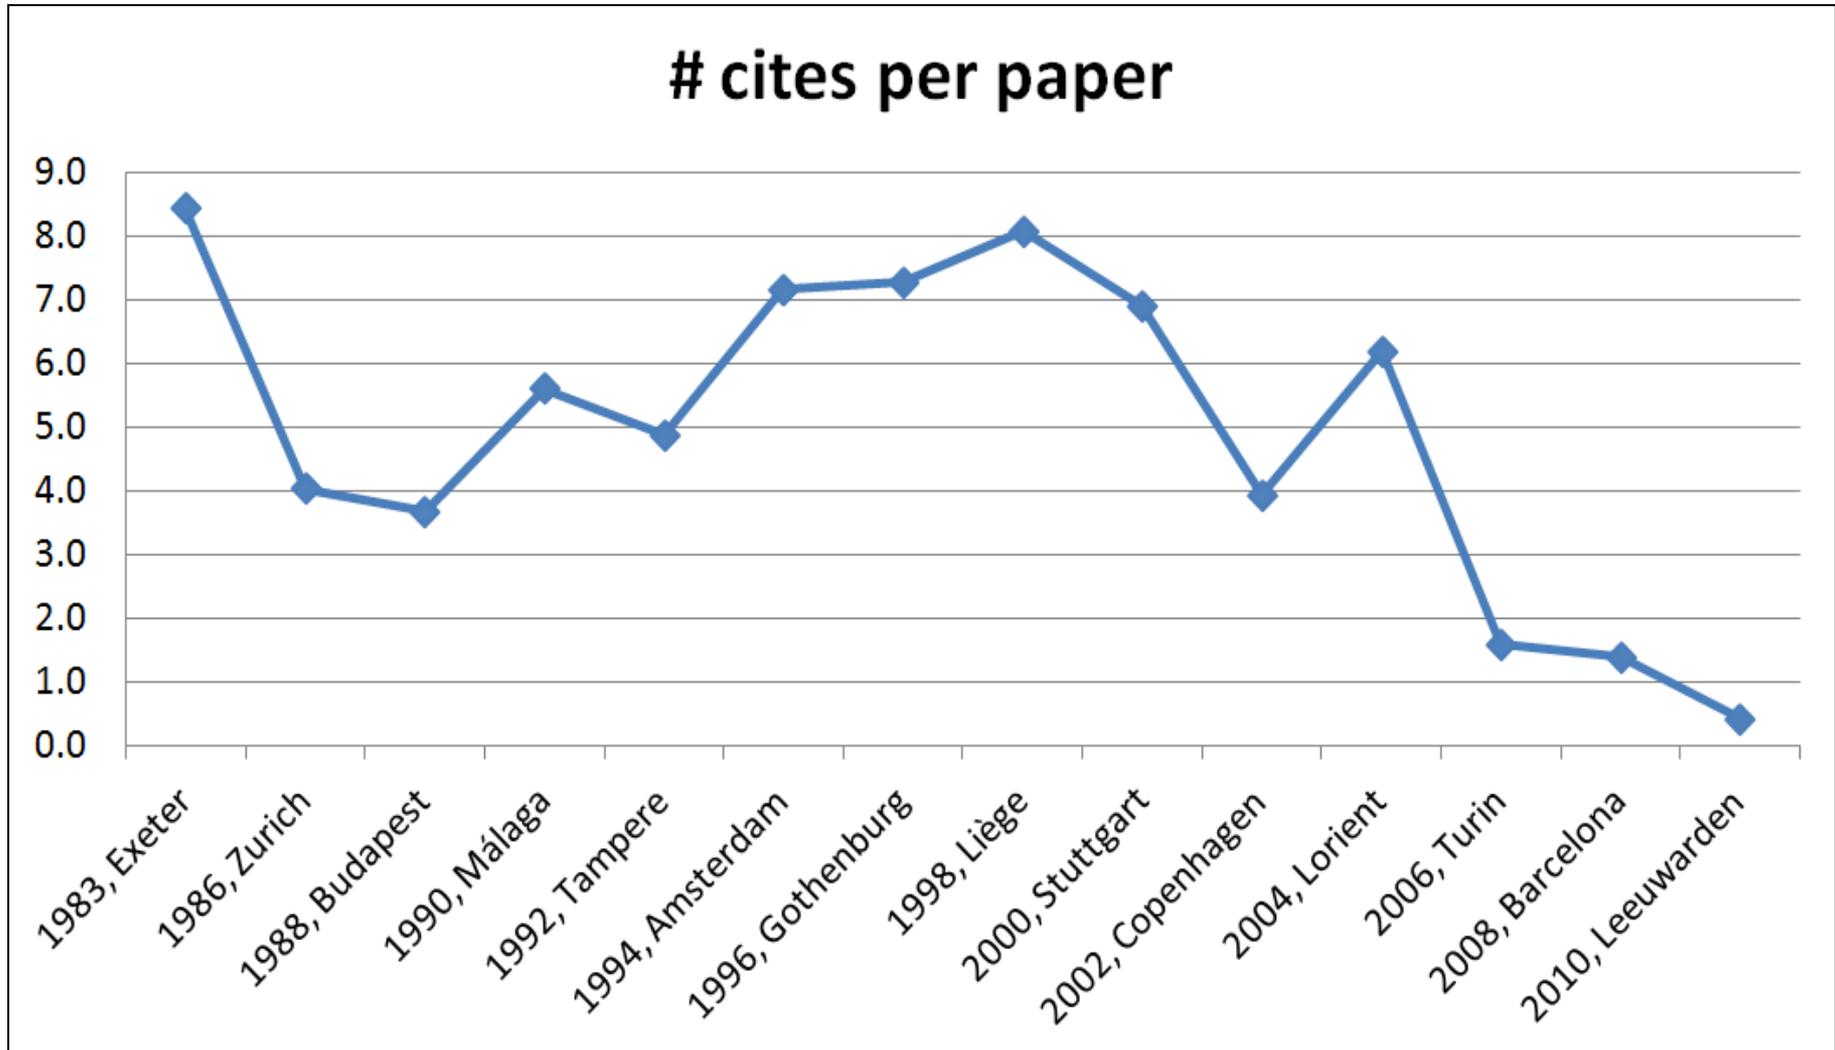

Number of cites, per congress

Discussion ...

- The actual number of references to the first fourteen congresses adds up to **5 220 cites**.
- In terms of overall cites, the **2004 (Lorient)** congress made the **biggest impact** so far.
- Of course this may be (and *is*) the result of just a **single very-high-impact paper**.
- A better way to study the data is therefore to look at the **average number of references per paper** presented at each congress.

Average number of cites per paper at each congress

Putting a face on the bleak statistics

- The sub-discipline of **computational lexicography** easily elbows out the more traditional aspects of the discipline.
- Especially **NLP topics** top the more recent lists.
- This is a trend **set in motion** at the **1992** (Tampere) congress, **gaining strength** at the **1994** (Amsterdam) and **1996** (Gothenburg) congresses, and **unleashed in full** as of the **1998** (Liège) congress.

Cites	Title	Author(s)	Year
349	The Sketch Engine	Kilgarriff, Adam; Rychlý, Pavel; Smrz, Pavel; Tugwell, David	2004

41	The FrameNet Database and Software Tools	Ruppenhofer, Josef; Baker, Collin F.; Fillmore, Charles J.	2002

4. THE EURALEX PROCEEDINGS CORPUS

Setting up for corpus analysis

- The EURALEX proceedings corpus =
 - the **full-text corpus** of all the papers and editorial material of the fifteen EURALEX congresses to date;
 - close to **five million running words**;
 - the **English part** is about **4 million words** strong, with 146 thousand distinct words.
- Why singling out the English component?
 - the idea is to **study trends** based on keywords;
 - not **enough data** with a good distribution for the other languages.

Setting up for corpus analysis

- Determining the keywords:
 - the EURALEX **proceedings corpus** was compared to the 100-million-word **BNC**;
 - overall **'keyness values'** were calculated;
 - using the **log-likelihood** statistic;
 - with **minimum frequency** set at **3**; and
 - maximum **probability** at **0.000001**.
- About **15 thousand types** were found to be **'key'** (i.e. positively outstanding).
- The **first 1 000** were **studied** in detail.

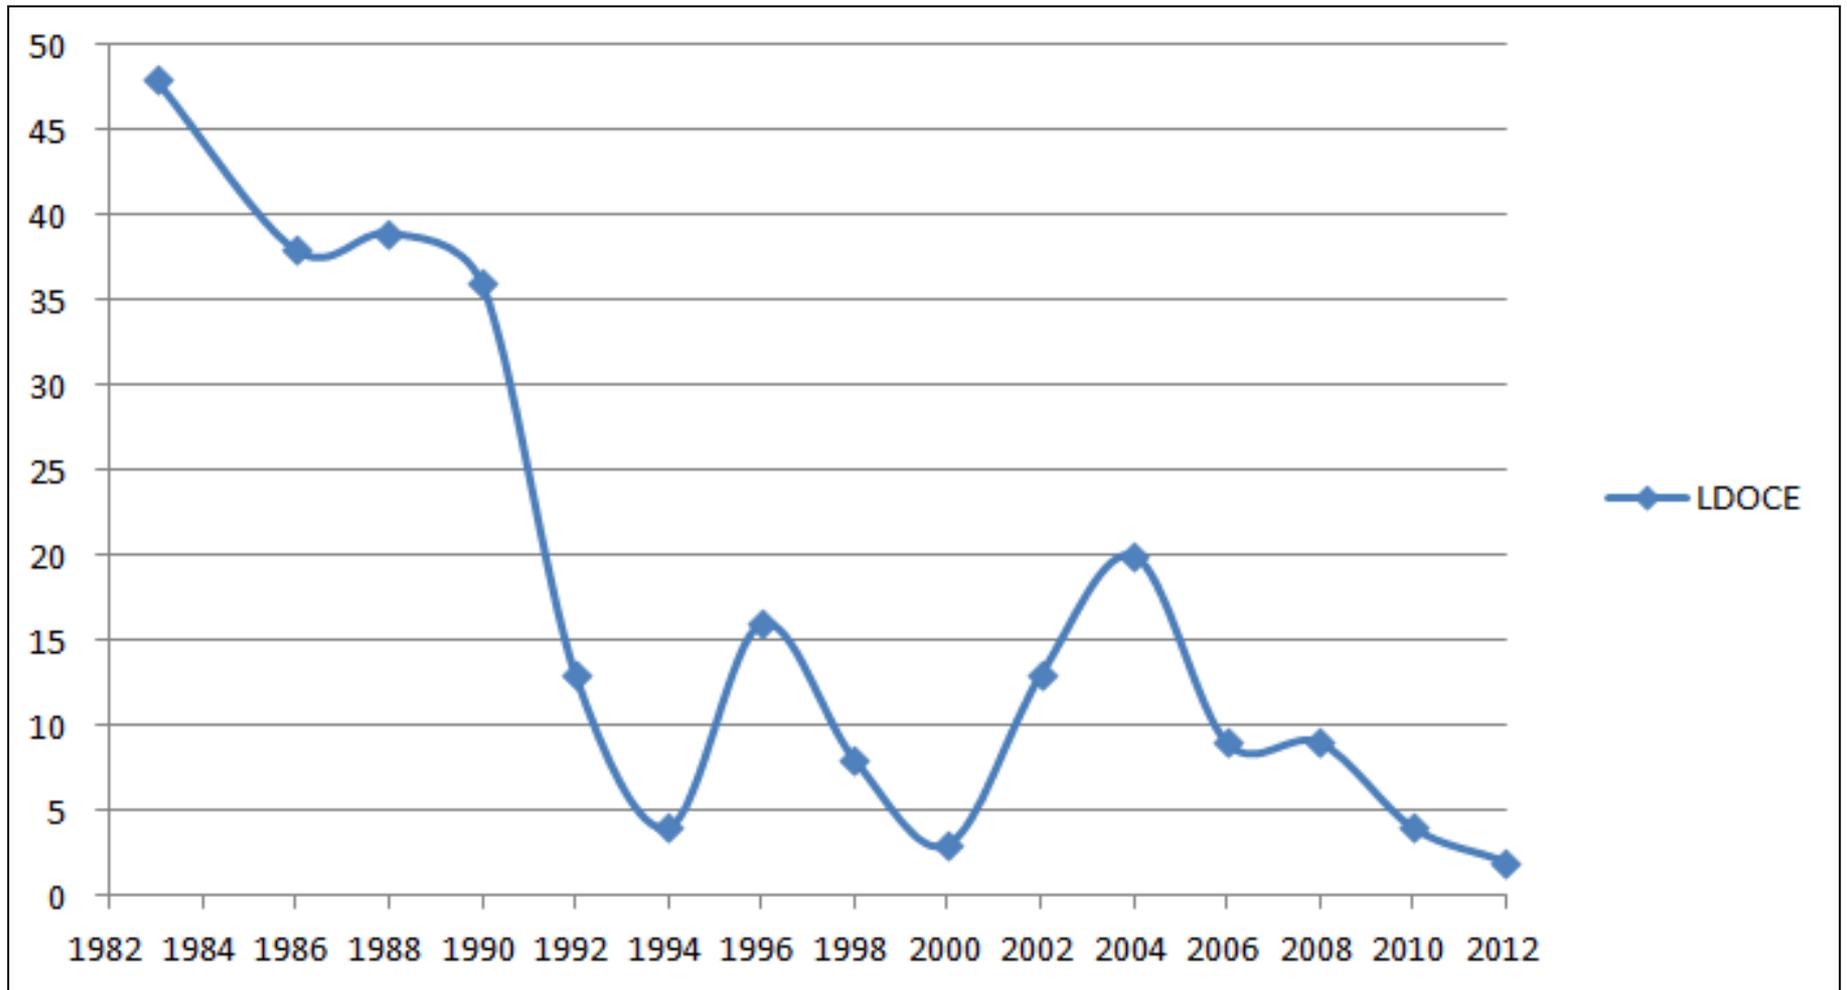

Setting up for corpus analysis

- For each of these 1 000 keywords, the **frequency** in each of the **fifteen congress sub-corpora** was determined.
- In order to be able to compare the frequencies across the congress sub-corpora the frequencies were **normalised** to show number of occurrences **per 100 thousand words**.
- The result of this analysis is shown in the **Addendum** of the printed version.

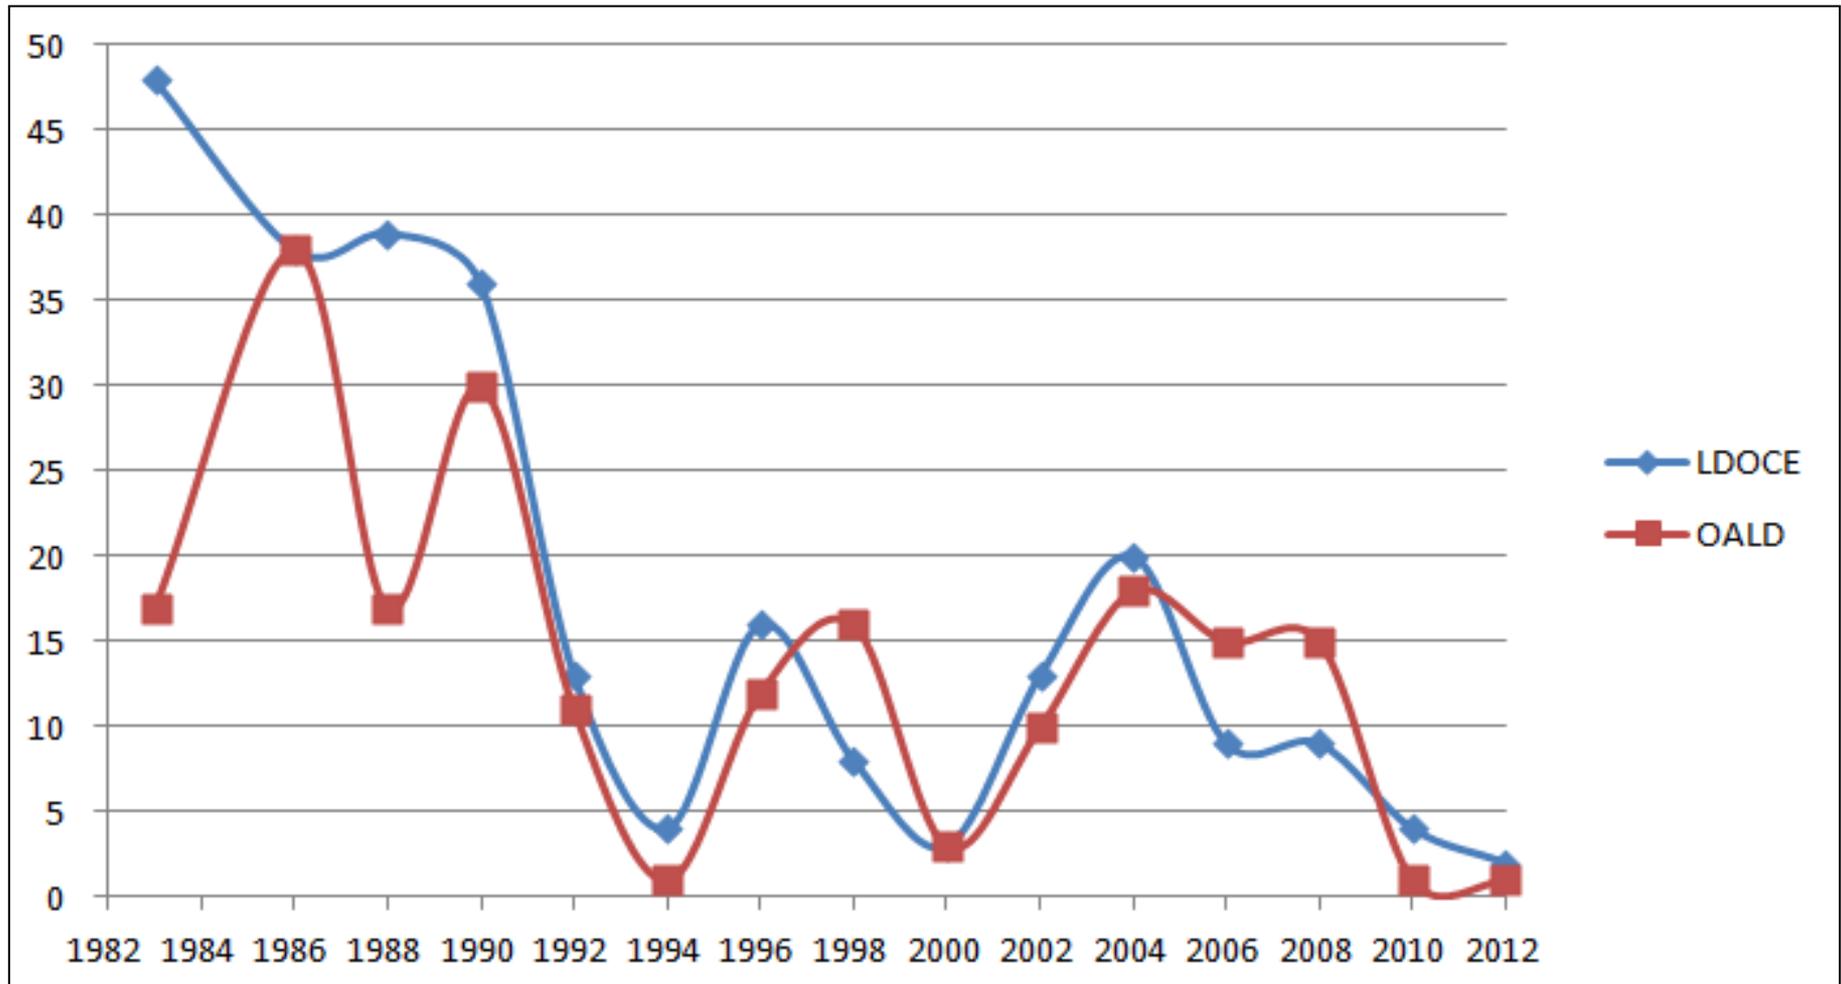

Setting up for corpus analysis

- The possible uses of the data shown in the Addendum are many and varied, and only a small selection will be presented here.
- The interested reader is invited to look at the Euralex keywords not covered, guided by their interest in certain topics.
- To begin with, however, a true EURALEX classic ...

Key scholars and their most significant congress impact(s)

- A total of 68 family names are found in the top 1 000 keywords.
- May be visualised in a radar chart (see next).
 - in descending order, clockwise starting at 12 o'clock;
 - the impact of the various scholars on each congress is also shown.

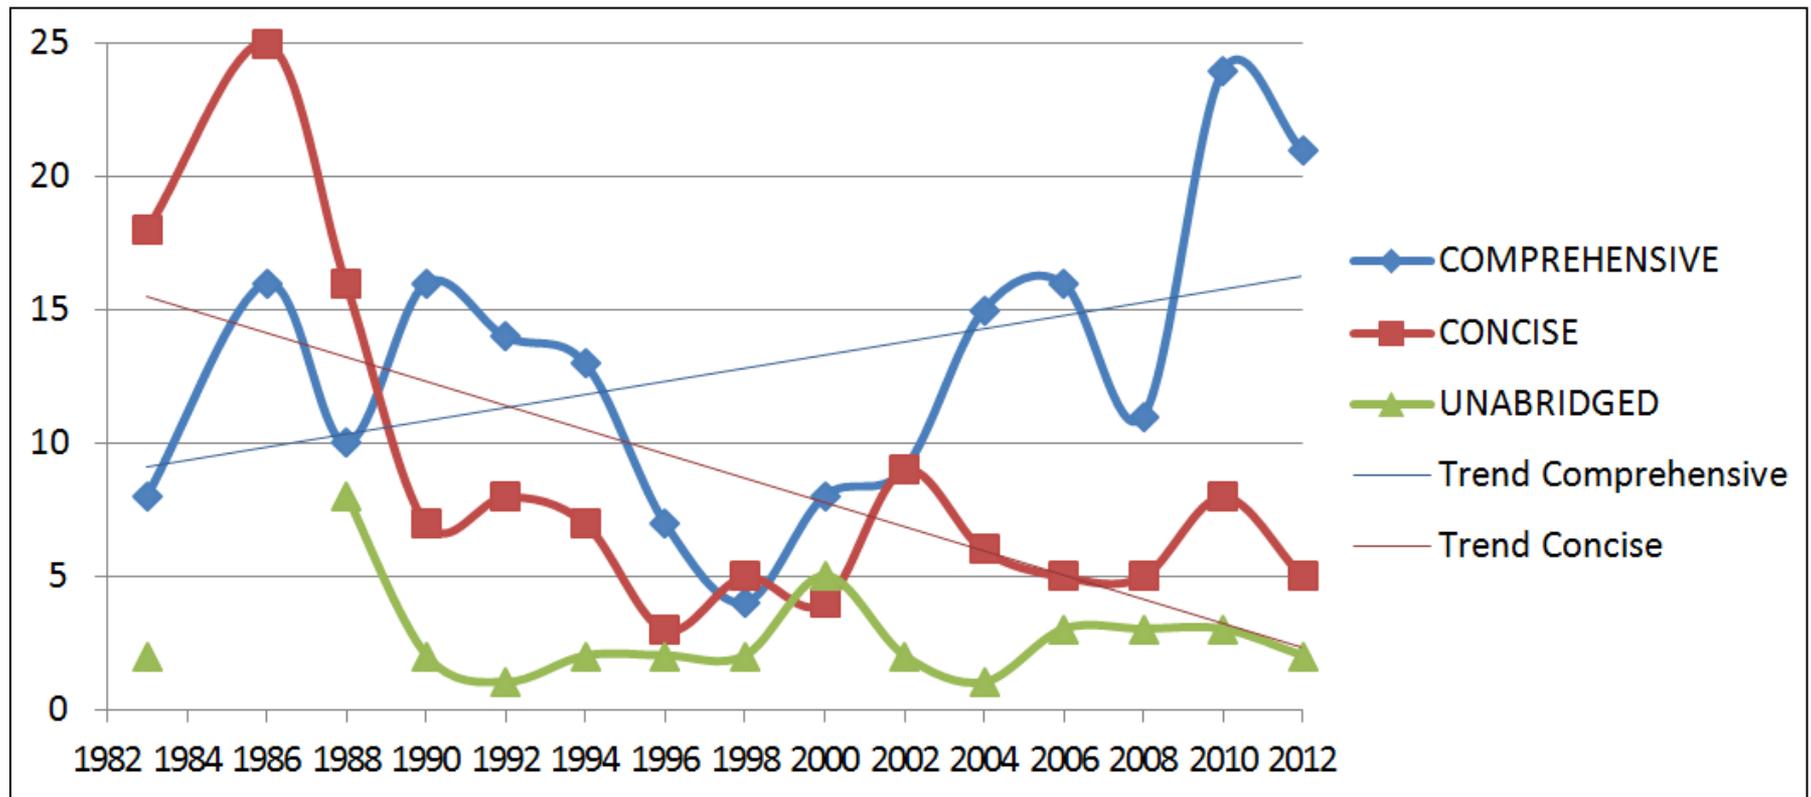

Discussion ...

- Note that the great majority of the scholars that **stand out** in the corpus are:
 - (a) **lexicographers** (as compared to linguists at large);
 - (b) **alive** (as compared to the great lexicographers of the past); and
 - (c) very **active at** the **EURALEX** congresses themselves.

5. A CRYSTAL-CLEAR OUTLOOK

Fortune-telling the future

- Having reviewed the facts and trends in three decades of EURALEX congresses, one would assume that it is **easy** to now fortune-tell the future.
- Surprisingly, **it is not**.

Fortune-telling the future

- Yes lexicography is **in transition** from a highly traditional art and craft, typically funded by publishers seeking profit from publication in book form, to a new interdisciplinary science in which publishers, software houses, freelancers and university researchers from a variety of disciplines all participate in creating electronic resources for a wide variety of different applications, typically for online use.
- This is the **present**.

Fortune-telling the future

- The future will **get rid of the book** components altogether, and the form the online components will take will be driven by the ever-faster-evolving technological exploits.
- Some of this technology will have been conjured up by teams of lexicographers, but in most cases lexicographers will simply **jump on the latest 'free' tool** offered by a search engine, a social network, or a data-mining team.

Fortune-telling the future

- To the average user ‘the dictionary’ will simply disappear from view, and drown in a sea of advertisement — customised, of course, amongst others based on the searches in the lexicographic components of whatever tools or networks they use.
- In order to get rid of the pestering advertisements, users will be able to Go Premium, but Big Brother will still be watching them and continue to build their evolving profile in the cloud.

Fortune-telling the future

- That what we now call lexicographic databases will end up in a variety of **social networks** is a given.
- There **lexicographic democracy** will take its course.
- **Machines**, too, will automatically populate lexicographic databases.

Fortune-telling the future

- **Stone Age lexicographers** will try to compete with these mediocre sources, by painfully analysing unimaginably large amounts of real language data and **crafting** delicate summaries, **mapping** meaning onto use, focusing on the **norms** in order to better describe the **exploitations**, building frequency-supported **patterns** for the various word classes.
- But without a Publishing House, by then called a **Marketing House**, their efforts will be futile.

Fortune-telling the future

- The future will bring out both the best and the worst of today's lexicographic **dreams**.

Where will this leave today's academic lexicographers?

- They will be frantically **looking for a theory** of lexicography, to justify their research position.
- They will, of course, not succeed, unless they **explain the plain obvious** in some newly invented language of their own.
- Or else, if they **keep on describing and categorizing** what has already been lumped and split a million times before.
- Calling it a theory does **not** make it a theory.

Where will this leave today's academic lexicographers?

- The smarter colleagues will simply realise that lexicography is a **synthetic science**.
- This science will need ever more knowledge and (real!) **theories from other disciplines** in order to move forward scientifically.

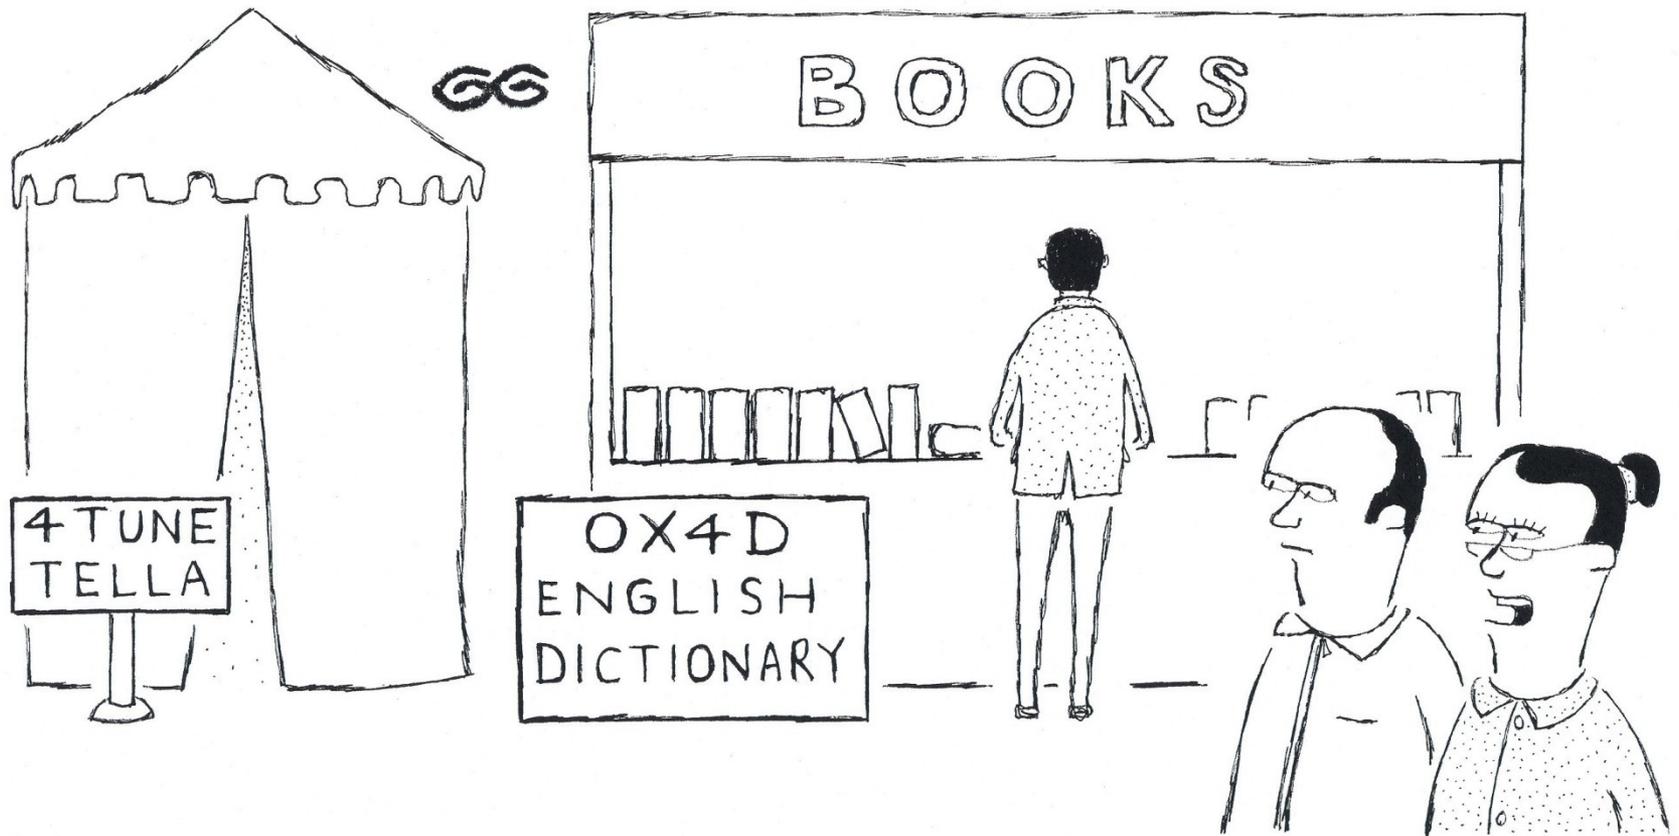

Where will this leave today's academic lexicographers?

- At congresses, ever more papers will be **co-authored** (the pressures to publish and be quoted will skyrocket).
- Each scholar will also be involved in **as many papers as possible**.
- The **PEOPLELEX** congresses — or whatever will succeed EURALEX and its sister associations, currently cut up along artificial borders — will be hosted by what is now the periphery.
- The current mainstream will come to realize that **the lexicographies and solutions of the periphery** have far more to contribute.

Where will this leave today's academic lexicographers?

- Lexicography as we know it today will **cease to exist**, lexicographers will be bringing together their data in **entirely new ways**, and dictionaries will **change beyond all recognition**.
- The times will still be as **exciting** as today, however, as we will be living in the future.

Takk!

'WHAT MAKES YOU THINK THEY'RE MODERN FAKES?'
