Lexicography in the Crystal Ball: Facts, Trends and Outlook

Gilles-Maurice de Schryver, Department of Languages and Cultures, Ghent University (Belgium) & Xhosa Department, University of the Western Cape, Cape Town (South Africa)

Keywords: EURALEX proceedings, papers, authors, countries, citations, trends.

Abstract

This year marks the fifteenth edition of the highly successful EURALEX congresses. In honour of this crystal jubilee, all major protagonists and topics of the fifteen congresses to date are reviewed, cross-compared with one another, and plotted through time. Three different databases were built to this intent: First, a EURALEX metadata database, containing all the bibliometric information of each paper, as well as the full affiliation details for each author. The language of each paper (English, French, Russian, ...) as well as its congress status (keynote, demo session, poster, ...) were also noted. From these data various paper, author, language and country trends are derived.

Second, a EURALEX citation database was constructed, in which each paper is linked with the citation data for that paper as found in Google Scholar. Various crosschecks were run, to improve on the search engine's suggestions. From these data various citation trends are derived, such as the percentage and number of papers cited per congress, the overall impact of each congress, and the average number of cites per paper at each congress. The actual top-cited papers are also looked at.

Third, a EURALEX proceedings corpus was built, with the full text of all the EURALEX papers delivered to date (including those presented in Oslo). Keywords and keyness values were extracted from this corpus, and the (normalized) frequencies of the top 1 000 keywords were then looked up in each congress sub-corpus. A detailed trend analysis of the most important of those keywords is then summarized in over forty charts.

In addition to the study of facts and trends, all this material is also used to predict the future, an outlook as reflected in the crystal ball.

1. The EURALEX congresses crystallize

Lexicography moves from milestone to milestone. Half a century ago 'a small group of linguists and lexicographers met at Indiana University to discuss a variety of problems related to the making of dictionaries' (Householder 1962: v). The proceedings of that conference (Householder & Saporta 1962) set in motion the emergence of lexicography as a modern scientific discipline. A decade later, Ladislav Zgusta's *Manual of Lexicography* (1971) gave every aspiring lexicographer something solid

to hold onto. And have we held onto it: Zgusta's magnum opus remains one of the most cited works of our field. Another decade later, another milestone. The year is 1983, when Reinhard Hartmann organizes a major international conference on lexicography in Exeter — baptized LEXeter '83 — where the basis is inter alia laid for the international encyclopaedia of lexicography Wörterbücher / Dictionaries / Dictionnaires (published a decade later, in three massive volumes), the book series Lexicographica. Series Maior (which started appearing in 1984) as well as the journal Lexicographica. International Annual for Lexicography (as of 1985), and last but not least, where the European Association for Lexicography itself - EURALEX - was established (cf. Hartmann 2008). The LEXeter '83 proceedings (Hartmann 1984) thereby automatically became the proceedings of the first EURALEX congress. The second EURALEX congress was organized in 1986, with the proceedings appearing two years later (Snell-Hornby 1988). From then on, EURALEX has gathered biennially, with proceedings appearing two years after the event for the third and fourth congress, and simultaneously with the event as of the fifth congress onwards. See Table 1 for an overview.

Although the EURALEX board went on to launch the quarterly International Journal of Lexicography in 1988, the material published in the biennial EURALEX proceedings held its own over the years. The body of research reported on in the EURALEX proceedings is now so substantial that an in-depth analysis is in order. This is exactly the aim of the present paper. In contrast to earlier attempts, the present analysis will not be a personal reflection (cf. Hartmann 2008), nor a proposal to build an online EURALEX congress proceedings bibliography (cf. DeCesaris & Bernal 2006). Instead, the present study is truly *driven* by the data in the proceedings. To that intent, a corpus was built containing all the material found in all fourteen proceedings published so far, as well as all the material (bar the current paper) accepted for presentation at the fifteenth congress.¹ In the corpus each paper (and each piece of editorial material) is a separate file with a unique identifier. All of these files, or any selection of it, can thus easily be searched and analysed with corpus query software. A separate database contains all the metadata for each file. Linking all the corpus files and the metadata is a so-called citation database, hinting at who quotes who, what, when, and where. In what follows selected aspects from each of these three components will be presented, starting with the EURALEX metadata database in Section 2, followed by the EURALEX citation database in Section 3, and finally the EURALEX proceedings database in Section 4. Section 5 will briefly conclude and look ahead.

Table 1: EURALEX congresses and proceedings to date.

2. The EURALEX metadata database

That EURALEX congresses have steadily grown over the years is well known, and obvious from the size of the proceedings, which go from onevolume books, to two- and even three-volume books, to books that contain the keynote papers only with merely abstracts for all other papers supplemented by CD-ROMs or a data stick for the full papers. The first four proceedings having been produced after the congresses took place, they do not necessarily contain all that was presented. Conversely, the proceedings of the next eleven congresses — the so-called *pre*ceedings do contain a few papers which were not presented in the end. Overall, however, the proceedings represent the congresses well, even though one should keep in mind that more activities are typically taking place at the congresses themselves, which may include workshops, symposia, round tables, structured debates, poster and demo sessions (before they started to be included as 'short papers' in the proceedings), etc. Not to forget the publisher booths and the social programme. What remains available for future reference, however, is the series of published proceedings.

There are ever more papers that are submitted, accepted and presented at EURALEX congresses, but what are the other paper and author dynamics? In Figure 1 the total number of papers per congress is shown.

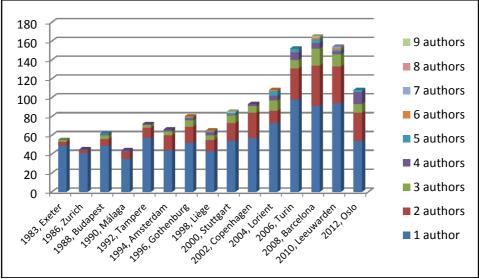

Figure 1: Papers per congress, showing number of authors per paper.

Clearly, the number of papers grew exponentially over the years, up to and including the 2008 congress, after which the number went down again, likely to a more manageable number (back to the level of the 2004 congress, with slightly over a hundred papers). In total, a massive 1 354 papers have been written so far.

In Figure 2 the same data is presented, but now expressed in percent. It can clearly be seen that the number of single-authored papers is steadily declining; in 2012 descending below the 50% level for the first time. The number of co-authors per paper indeed tends to grow with each new congress, with especially two, three and four co-authors becoming popular, and even two cases of nine authors in all (in 2000 and 2008). Here one dares suggest that lexicography is becoming ever more

complex, needing the input of more than one scholar, and especially the input from multiple disciplines.

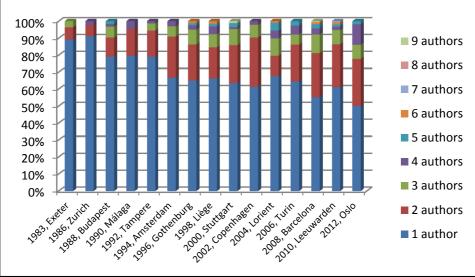

Figure 2: Papers per congress, with number of authors per paper in %.

Overall, there are 2 130 authors for the 1 354 papers written so far, and from Figure 3 it can be seen that the number of authors per paper rose — nearly linearly — from an average of about 1.1 three decades ago, to about 1.9 today. The average number of authors per paper nearly doubled.

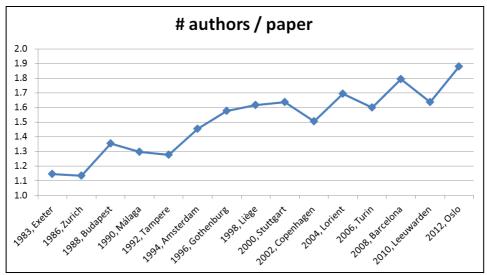

Figure 3: Average number of authors per paper at each congress.

A linked aspect is shown in Figure 4, which indicates that also the number of scholars who are involved in multiple papers at the same congress is on the rise. This is a phenomenon that started in 1994, where about 3% of the presenters were involved in multiple papers, a figure which has risen to over 10% today.

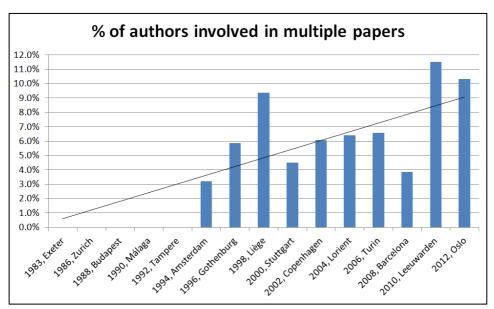

Figure 4: % of authors involved in multiple papers at each congress.

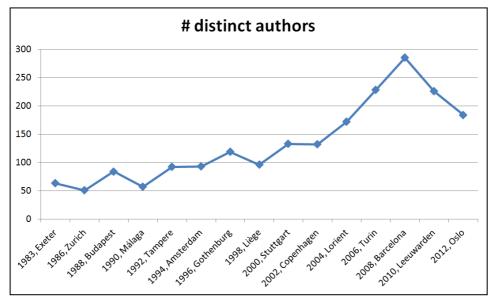

Figure 5: Number of distinct (i.e. unique) authors at each congress.

Given that ever more scholars co-write (and co-present) papers, the actual number of distinct (i.e. unique) authors is thus lower than 2 130. Figure 5 shows that number per congress. Over the years, this metric went from about 50 (in 1983) to nearly 300 (in 2008), and is now back at about 200 authors (in 2012). Still an impressive number.

EURALEX congresses are not isolated events, but truly part of a series, and loyal and even very loyal colleagues do join in with papers time and again. A study of all authors, across all fifteen congresses, reveals that a grand total of 1 371 distinct scholars have written papers for EURALEX over the the past three decades. 1 030 were involved in just one paper, 183 were involved in two papers, 69 in three papers, etc. And the maximum? One colleague each was involved in no less than 11 papers, one in 12, one in 15, and the very maximum, one in a staggering 19 papers. The distribution is clearly Zipfian, as shown in Figure 6.

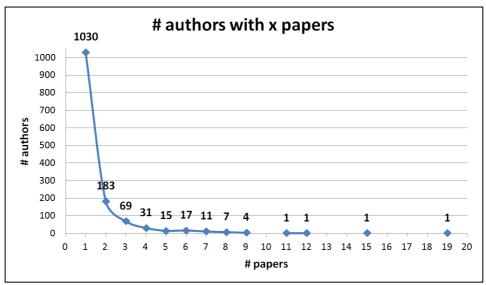

Figure 6: Number of authors with x papers, across all congresses.

The list of these returning authors is shown in Table 2, which is colourcoded for easy reading, and limited to those authors involved in at least six papers. To the insider, it will of course not really come as a surprise to see that Ulrich Heid, Adam Kilgarriff, Patrick Hanks and Thierry Fontenelle top this list. Each of them has become synonymous with major developments in the field at large, and it is gratifying to see their devotion to EURALEX. All other scholars listed in Table 2 are most certainly 'must-reads' as well.

	Papers	983	9861	1988	1990	1992	1994	1996	1998	2000	2002	2004	2006	2008	2010	2012

Table 2: Author returns across the various congresses (with > 5 papers).

EURALEX would not be a *European* Association for Lexicography if it didn't welcome papers in languages other than English. Nine languages have been used for the 1 354 papers to date: 1 099 were in English (81.2%), 92 in French (6.8%), 62 in German (4.6%), 50 in Spanish (3.7%), 31 in Italian (2.3%), 10 in Russian (0.7%), 6 in Portuguese (0.4%), 3 in Catalan (0.2%), and a single one in Finnish (0.1%).

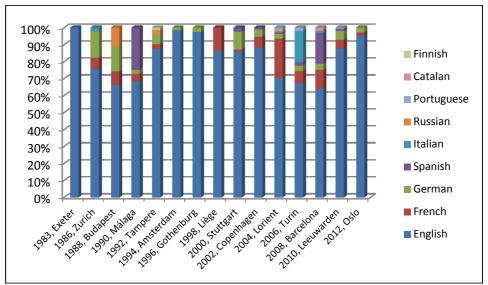

Figure 7: Languages of papers, in % per congress.

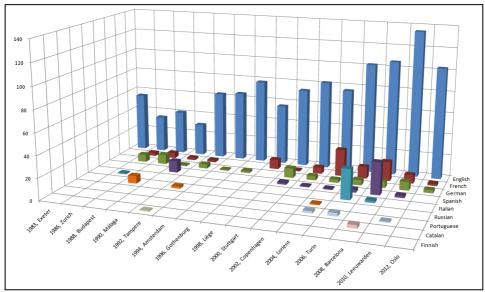

Figure 8: Languages of papers, actual number per congress.

Figure 7 shows the distribution expressed in percent per congress, while Figure 8 shows the actual number of papers per language and per congress in a three-dimensional view. EURALEX congresses clearly seem to act as a magnet for local researchers, turning EURALEX congresses in combined international and national gatherings as they move around the continent. Witness the surge of papers in Spanish in Málaga (1990) and Barcelona (2008), French in Liège (1998) and Lorient (2004), German in Stuttgart (2000), and Italian in Turin (2006). Or the papers in German, French and Italian in Zurich (1986), and even the inclusion of Russian and Finnish in Tampere (1992). The papers in German and Russian in Budapest (1988) were a smart move by the then EURALEX board to open up the Association to the East, a move with positive repercussions to this date. Simultaneously, these figures tell us something about northern Europeans as well, as they are clearly very comfortable in someone else's language: the Dutch in Amsterdam (1994) and Leeuwarden (2010), the Swedes in Gothenburg (1996), the Danes in Copenhagen (2002), and the Norwegians in Oslo (2012). Most of them use English. In Exeter (1983), English was the sole language.

A final aspect that may be extracted from the EURALEX metadata database concerns the affiliations (typically one, sometimes more) of the various authors. In the interest of space, these will be limited to the countries of the affiliations listed for each author. Overall, a total of 2 157 affiliations have been mentioned so far, and the country distribution is as shown in Table 3. Quite surprisingly, the top two spots are for Spain and Italy. But then, given the very large number of papers presented in Barcelona (2008) and Turin (2006), this can be (partly) explained after all.

Region	Sub-region	Country	Papers	%
Europe	Southern Europe	Spain	222	10.29%
Europe	Southern Europe	Italy	199	9.23%
Europe	Northern Europe	United Kingdom	192	8.90%
Europe	Western Europe	Germany	179	8.30%
Europe	Western Europe	The Netherlands	141	6.54%
Europe	Western Europe	France	127	5.89%
America	North America	USA	100	4.64%
Europe	Western Europe	Belgium	86	3.99%
Europe	Eastern Europe	Russia	75	3.48%
Europe	Northern Europe	Denmark	71	3.29%
America	North America	Canada	63	2.92%
Europe	Northern Europe	Sweden	62	2.87%
Europe	Eastern Europe	Czech Republic	57	2.64%
Africa	Southern Africa	South Africa	49	2.27%

Table 3: Country distribution of the affiliations for all authors.

Europe	Eastern Europe	Poland	49	2.27%
Asia	East Asia	Japan	37	1.72%
Europe	Western Europe	Switzerland	36	1.67%
Europe	Western Europe	Austria	35	1.62%
Europe	Eastern Europe	Hungary	32	1.48%
Europe	Northern Europe	Ireland	30	1.39%
Europe	Southern Europe	Slovenia	27	1.25%
Europe	Northern Europe	Norway	26	1.21%
Europe	Northern Europe	Finland	25	1.16%
Europe	Northern Europe	Estonia	24	1.11%
Europe	Southern Europe	Portugal	20	0.93%
Asia	East Asia	South Korea	19	0.88%
Asia	West Asia	Israel	18	0.83%
Europe	Eastern Europe	Romania	17	0.79%
Europe	Northern Europe	Latvia	16	0.74%
Oceania	Australasia	Australia	15	0.70%
Europe	Southern Europe	Greece	15	0.70%
America	South America	Brazil	11	0.51%
America	North America	Mexico	11	0.51%
Europe	Southern Europe	Cyprus	9	0.42%
Asia	East Asia	Hong Kong	7	0.32%
Europe	Eastern Europe	Bulgaria	6	0.28%
Europe	Southern Europe	Croatia	6	0.28%
America	Carribean	Cuba	6	0.28%
Europe	Northern Europe	Lithuania	5	0.23%
Europe	Eastern Europe	Slovakia	5	0.23%
Asia	South Asia	Pakistan	4	0.19%
Asia	East Asia	China	2	0.09%
Asia	West Asia	Georgia	2	0.09%
Asia	West Asia	Kuwait	2	0.09%
Europe	Western Europe	Luxembourg	2	0.09%
Africa	North Africa	Morocco	2	0.09%
Oceania	Australasia	New Zealand	2	0.09%
Europe	Eastern Europe	Ukraine	2	0.09%
Europe	Southern Europe	Albania	1	0.05%
America	Carribean	Barbados	1	0.05%
Africa	North Africa	Egypt	1	0.05%
Europe	Northern Europe	Iceland	1	0.05%
Asia	West Asia	Iran	1	0.05%
Europe	Southern Europe	Serbia	1	0.05%
Asia	Southeast Asia	Singapore	1	0.05%
Africa	East Africa	Tanzania	1	0.05%
Africa	East Africa	Uganda	1	0.05%
			2 157	100.00%

Summarizing the data from Table 3 further, one arrives at the pie diagram shown in Figure 9, from which one sees that plainly 83.5% of all affiliations are European, which is satisfactory for a European Association, but also, and more importantly, that 16.5% are non-European, viz. 8.9% from the Americas, 4.3% from Asia, 2.5% from Africa, and 0.8% from Oceania.

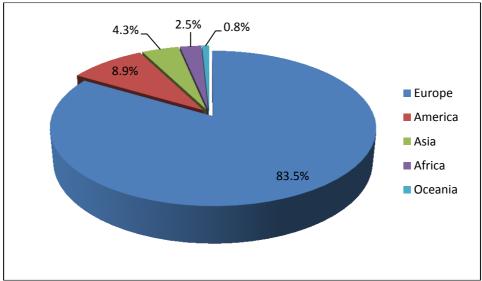

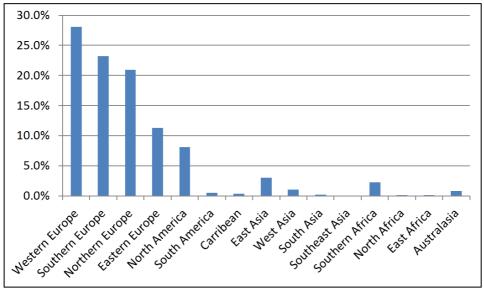

Figure 9: Region distribution of the affiliations for all authors.

Breaking this up per sub-region, Figure 10 is obtained.

Figure 10: Sub-region distribution of the affiliations for all authors.

If one now wants to see when certain regions contributed what to a particular congress, then Figure 11 may be consulted. From it, one can for example confirm that the congresses in Lorient (2004), Turin (2006) and Barcelona (2008) indeed attracted a lot of colleagues from Southern

Europe, or that the Leeuwarden congress attracted more colleagues from Western Europe than ever before. Or, to focus on another continent, the run-up to 1994 (when South Africa officially shed apartheid) saw the arrival of relatively large numbers of South African colleagues, who have remained very loyal to this date.

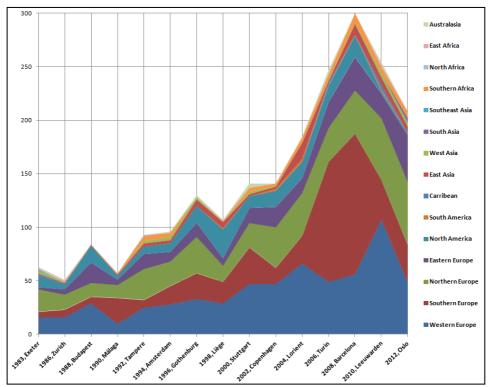

Figure 11: Sub-region contribution at each congress.

3. The EURALEX citation database

Not all papers make a lasting impact. Those that do, typically attract a number of citations over the years. Although this is not a substitute for inherent quality — after all, one can theoretically also and only refer to a paper merely to point out its infelicities — high citation counts typically correspond to satisfaction. Writing in 2012, the most convenient way to determine a paper's citations is simply to query Google Scholar, which has only recently come out of beta. The EURALEX citation database was built for this purpose. In it all the necessary paper information and programming codes have been imbedded so as to extract the number of

cites for each paper at any given point in time. In what follows, the citation status in Google Scholar as reflected on 24 July 2012 is used. Needless to say, the Google Scholar database does *not* see everything (yet), so all values are minimum values. Given a congress paper first has to be published this section of the study looks at all the papers from the first fourteen congresses only. In all, there are 1 246 papers for this period, 668 (or thus 53.6%) of which have been cited at least once. The distribution across the congresses is not even, however. As may be expected, papers from the earlier congresses have had more time to attract a readership and thus have a better chance at being quoted. This trend is confirmed by the data, as shown in Figure 12.

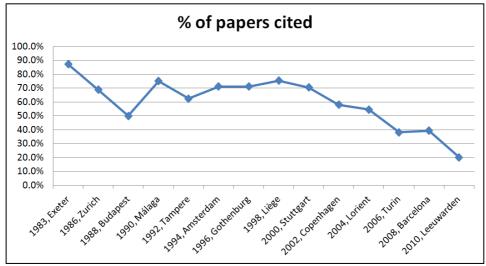

Figure 12: Percent of papers cited, per congress.

While as many as 87.3% of the papers from 1983 (Exeter) have been cited, only 20.1% of those from 2010 (Leeuwarden) have. In-between, the trend is to decline as one reaches the present.

Because more and more papers are presented at each new congress, however, the actual number of papers being quoted is actually rising, as may be seen from Figure 13. Between 1986 (Zurich) and 2008 (Barcelona) the number of quoted papers more than doubles, from 31 to 65. The drop for 2010 (Leeuwarden) is clearly the result of its proximity to the present: papers quoting material from 2010 need at least a year, typically more, to make it to publication (or even advance access) status.

The actual number of references to the first fourteen congresses adds up to 5 220 cites. Figure 14 shows the distribution per congress.

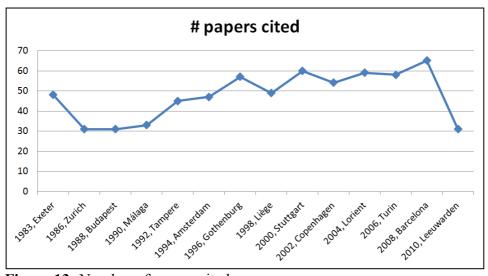

Figure 13: Number of papers cited, per congress.

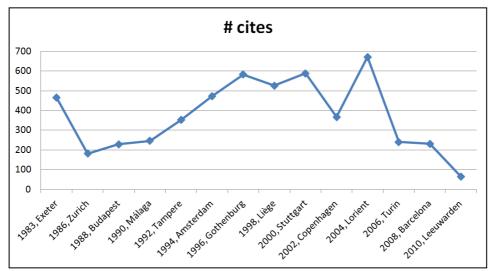

Figure 14: Number of cites, per congress.

In terms of overall cites, then, the 2004 (Lorient) congress made the biggest impact so far. Of course this may be (and *is*, see below, Table 14) the result of just a single very-high-impact paper.

A better way to study the data is therefore to look at the average number of references per paper presented at each congress. Here one expects to find a downward trend, but while the value is indeed highest in 1983 (8.5 cites per paper) and lowest in 2010 (0.4 cites per paper), the trend in-between is surprising, as shown in Figure 15.

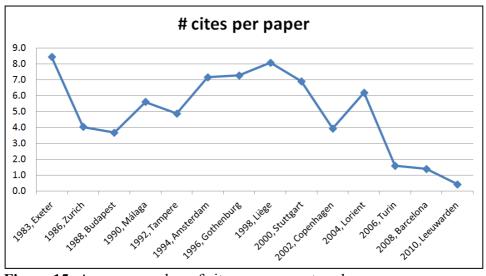

Figure 15: Average number of cites per paper at each congress.

What this graph reveals is that 'the middle congresses' — i.e. 1994 (Amsterdam), 1996 (Gothenburg), 1998 (Liège) and 2000 (Stuttgart) — have been the most successful in terms of 'papers put in, citations got out'.

In order to put a face on the bleak statistics depicted in Figures 12 to 15, one can now pass in review the various papers that attracted many citations to date. Given the highest averages are close to nine in Figure 15, all papers with at least ten cites will be listed now, grouped per congress.²

Going through these lists, shown in Tables 4 through 17, it is clear that the sub-discipline of computational lexicography easily elbows out the more traditional aspects of the discipline. NLP topics especially, top the more recent lists, a trend set in motion at the 1992 (Tampere) congress, gaining strength at the 1994 (Amsterdam) and 1996 (Gothenburg) congresses, and unleashed in full as of the 1998 (Liège) congress. The congress organizers also need to be commended on their choice of keynote speakers, as many of the keynote papers (their number of cites are shaded in the tables below) became true classics. In analyzing these citation counts it is good to remember that we are not looking at data from the exact sciences, where top papers attract hundreds or even thousands of citations, but at a field where several dozen citations indicates excellence, and where a hundred or more citations is only given to a few. In addition to papers in English, the top-cited material also includes papers in Spanish, French and German.

4. The EURALEX proceedings corpus

The EURALEX proceedings corpus — that is the full-text corpus of all the papers and editorial material of the fifteen EURALEX congresses to date — contains close to five million running words. The breakdown per congress may be seen in Table 18, which also includes information on the number of files in each congress sub-corpus, as well as, within that, information on the number of papers and editorial materials in English, and tokens and types for these. The English part is about 4 million words strong, with 146 thousand distinct words. The reason for singling out the English component in the present section of the study is that the idea is to study trends based on keywords. This is done for one language, English, as there is simply not enough data with a good distribution for the other languages (cf. Figures 7 and 8).³

No.	Year	City	Files	Tokens	Engl.	Engl. ed	Engl.	Engl.
		-			papers	material	tokens	types
1	1983	Exeter	64	174,869	55	9	174,869	16,593
2	1986	Zurich	58	158,126	34	11	122,064	14,036
3	1988	Budapest	76	214,127	41	14	154,608	15,627
4	1990	Málaga	57	208,130	30	11	133,602	16,157
5	1992	Tampere	85	251,985	63	12	229,993	21,150
6	1994	Amsterdam	70	223,759	65	4	222,217	19,172
7	1996	Gothenburg	92	248,985	78	10	235,369	19,504
8	1998	Liège	81	269,827	56	13	230,003	18,549
9	2000	Stuttgart	106	308,516	73	20	257,766	18,508
10	2002	Copenhagen	95	343,779	82	1	288,952	27,193

Table 18: Congress sub-corpora of the EURALEX proceedings corpus.	Table 18: Congr	ess sub-corporation	a of the EUR	ALEX pro	oceedings corpus
---	-----------------	---------------------	--------------	----------	------------------

In order to determine the keywords in the (English section of the) EURALEX proceedings corpus, that corpus was compared to the 100-

million-word BNC. More specifically, the frequencies of all types in the EURALEX proceedings corpus and the frequencies of all types in the BNC were cross-tabulated, and overall 'keyness values' calculated using the log-likelihood statistic, with minimum frequency set at 3, and maximum probability at 0.000001. About 15 thousand types were found to be 'key' (i.e. positively outstanding) in the EURALEX proceedings corpus. After deleting the types that are merely the result of the academic register used in the proceedings, the first 1 000 were studied in detail. For each of these 1 000 keywords, the frequency in each of the fifteen congress sub-corpora was determined. In order to be able to compare the frequencies across the congress sub-corpora the frequencies were normalised to show number of occurrences per 100 thousand words. The result of this analysis is shown in the Addendum, which forms the core of the ensuing discussion.

The possible uses of the data shown in the Addendum are many and varied, and only a small selection will be presented here. The interested reader is invited to look at the keywords not covered, guided by their interest in certain topics. To begin with, however, a true EURALEX classic: How have the Big Five (initially Big Four) monolingual learners' dictionaries (MLDs) faired over the past few decades at EURALEX congresses? This question is answered in Figure 16.

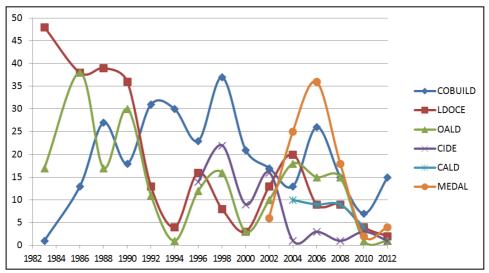

Figure 16: Trend for the Big Five monolingual learners' dictionaries.

At the start of the 1980s LDOCE ruled the proceedings, but lost its lustre with time. OALD followed a largely similar path. COBUILD, on the

other hand, started to make noise even before their first product came out (in 1987), continued to attract ever more attention, and even though interest has somewhat waned, it remains by far the most talked about and most-studied MLD. CIDE enters the EURALEX scene in 1996 (their first edition came out in 1995), but quickly lost a following. The rebranding to CALD didn't help. MEDAL (first published in 2002) had a rocket start, becoming the most popular MLD in 2006, but it too has lost a large following. COBUILD, then, must get *something* right ...

A similar approach can now be followed for other dictionary abbreviations listed among the keywords. In Figure 17, for example, four different types of English dictionaries are shown: OED, CED (*Collins English Dictionary*), BBI (*The BBI Combinatory Dictionary of English*), and Roget (*Roget's Thesaurus of English Words and Phrases*). The graph speaks for itself, with the OED more or less always on top, and hugely popular in the 1980s, and again at present.

In Figure 18 WAT (*Woordeboek van die Afrikaanse Taal*), WNT (*Woordenboek der Nederlandsche Taal*), ANW (*Algemeen Nederlands Woordenboek*), and WFT (*Wurdboek fan de Fryske Taal*) are shown. WAT is surprisingly more in the picture than WNT. Also note the post-apartheid peak in 1994 for the WAT.

The exercise is repeated for two Danish and two Swedish dictionaries in Figure 19: STO (SprogTeknologisk Ordbase, a computational lexicon for Danish), SAOL (Svenska Akademiens ordlista), LEXIN (a dictionary series primarily aimed at immigrants to Sweden), and DDO (Den Danske Ordbog); for dictionaries involving German in 20: (Elektronisches Lernerwörterbuch Figure ELDIT Deutsch-Italienisch), OWID (Online-Wortschatz-Informationssystem Deutsch), and DWDS (Digitales Wörterbuch der Deutschen Sprache); and for dictionaries of Romance languages in Figure 21: DDLC (Diccionari Descriptiu de la Llengua Catalana), DRAE (Diccionario de la Real Academia Española), and COMBINATOIRE (Dictionnaire explicatif et combinatoire du français contemporain). Some of these trends clearly oscillate together with the location of the congress, as do the popular language pairs, as depicted in Figure 22.

It is important to realize that all of these trends are solely based on the occurrence of dictionary abbreviations in the corpus, not on the full titles of the works. If one does the latter, one also includes the list of references of each paper, at which point one is actually studying publisher patterns rather. Figure 23 shows exactly this for a number of British dictionary publishers, Figure 24 for a number of US / continental ones, and Figure 25 for Italian ones.

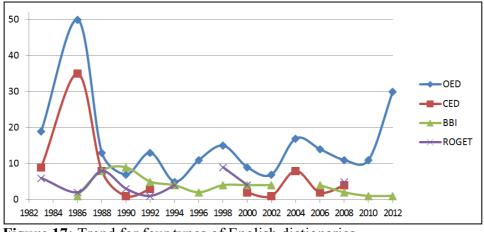

Figure 17: Trend for four types of English dictionaries.

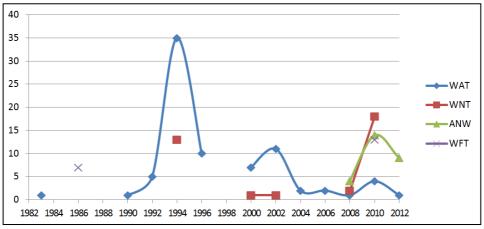

Figure 18: Trend for four dictionaries in Afrikaans, Dutch and Frisian.

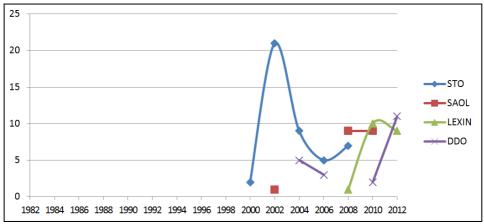

Figure 19: Trend for two Danish and two Swedish dictionaries.

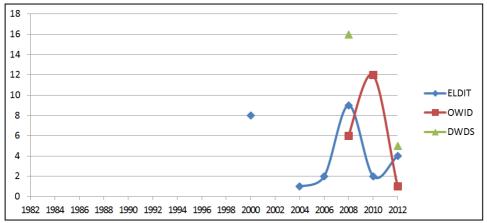

Figure 20: Trend for dictionaries involving German.

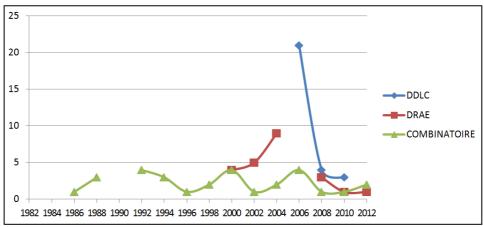

Figure 21: Trend for dictionaries of Romance languages.

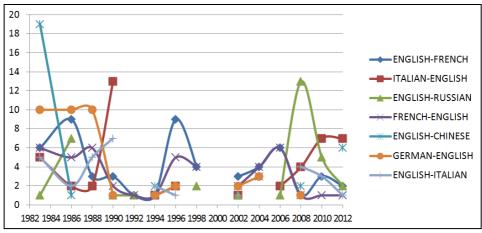

Figure 22: Trend for popular dictionary language pairs.

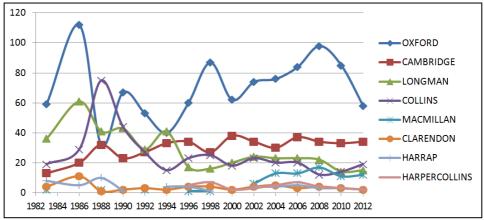

Figure 23: Trend for a number of British dictionary publishers.

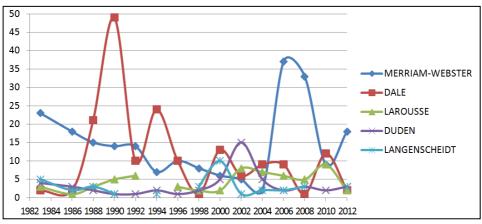

Figure 24: Trend for a number of US / continental dictionary publishers.

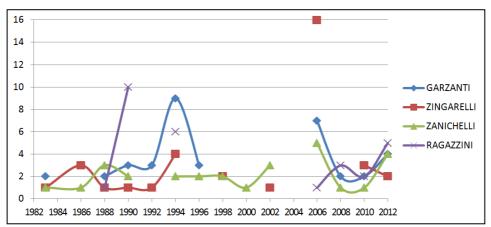

Figure 25: Trend for a number of Italian dictionary publishers.

To complete the picture for the publishers, one can also briefly look at the trends for publishers of more general linguistic works, as is done in Figure 26. From this, Benjamins appears to be the rising star.

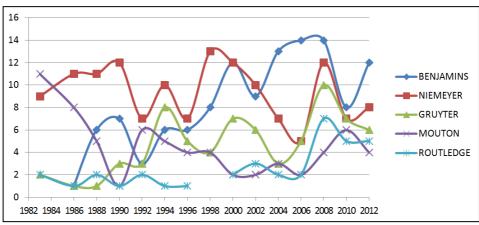

Figure 26: Trend for publishers of general linguistic works.

Moving to the issue of the languages being discussed at EURALEX congresses, all the languages that appear in the top 1 000 keywords were analysed and the trends are shown for each in Figures 27 through 33. One first needs to point out that the attention to English is so overwhelming that it cannot really be represented with the others on the same graph. See in this regard Figure 27, which indicates that English receives three to four times more attention than its nearest neighbours: French and German. At the same time, though, the attention to English *is* diminishing (from about 400 occurrences for every 100 thousand words, to about 300 occurrences for every 100 thousand words).

The situation for the Romance languages is summarized in Figure 28: French is giving way to Italian and Spanish, and currently Romanian. Figure 29 shows the Germanic languages (bar English): German loses some way to Dutch and Swedish, and currently Norwegian. With regard to the Slavic languages, as shown in Figure 30, it is clear that Russian is slowly being replaced by Czech and Polish. For the Uralic languages, as seen in Figure 31, Estonian is gaining ground, as is currently Sami. Hungarian was very much in the picture in 1988, at the congress in Budapest. From Figure 32 one may conclude that Greek has been covered continuously, albeit to a limited extend, while the language isolate Basque is true to its status: it appears isolated. Finally, Figure 33 tells us that only three non-European languages made it into the top keyword list: Arabic, and two Bantu languages from South Africa: Northern Sotho and Venda.

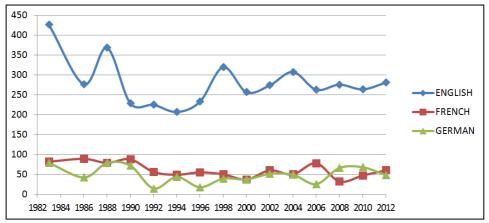

Figure 27: Trend for English vs. French and German.

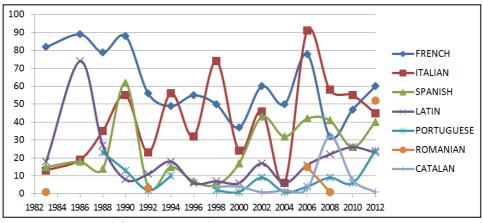

Figure 28: Trend for Romance languages.

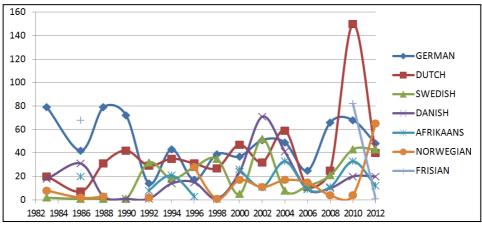

Figure 29: Trend for Germanic languages.

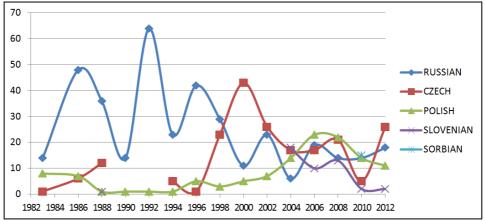

Figure 30: Trend for Slavic languages.

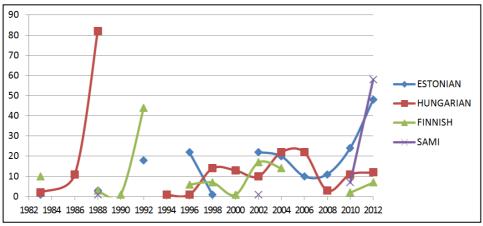

Figure 31: Trend for Uralic languages.

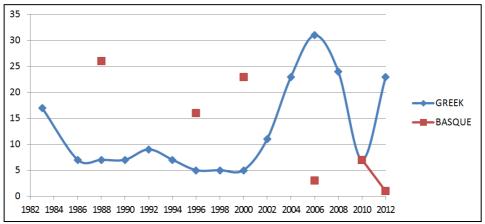

Figure 32: Trend for Greek and Basque.

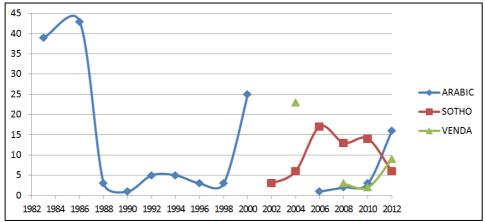

Figure 33: Trend for Arabic and two South African Bantu languages.

The next question the keywords may try to answer is whether there are any scholars who stand out in the corpus. As it turns out, a total of 68 family names are found in the top 1 000 keywords (no first names were found),⁴ and these have all been visualised in the radar chart of Figure 34, in descending order, clockwise starting at 12 o'clock with ATKINS. The impact of the various scholars on each congress is also shown. Herbert Wiegand, for example, made his greatest impact at the 1983 (Exeter) congress, Robert Ilson at the 1990 (Málaga) congress, Sue Atkins at the 1994 (Amsterdam) and 1996 (Gothenburg) congresses, Albert Hornby at the 1998 (Liège) congress, Hilary Nesi at the 2000 (Stuttgart) congress, etc. while Patrick Hanks and Adam Kilgarriff are making their greatest impact right now, at the 2012 (Oslo) congress. Note that the great majority of the scholars that stand out in the corpus are (a) lexicographers (as compared to linguists at large), (b) alive (as compared to the great lexicographers of the past), and (c) very active at the EURALEX congresses themselves (cf. e.g. Tables 4 through 17).

Zooming into lexicography proper, the next series of trend graphs looks at the type of dictionaries being discussed. From Figure 35 one may conclude that bilingual dictionaries present more challenging problems than monolinguals do, but also that most lexicographers try to steer away from multilingual dictionaries as well as from bilingualized and semibilingual dictionaries. The term interlingual only shimmers through. The peak for bilingualised in 1994 refers to Laufer & Melamed's seminal study on the topic (cf. Table 9).

With regard to dictionary size, Figure 36 indicates that the comprehensive dictionary and discussions about it are on the rise, at the expense of the concise dictionary.

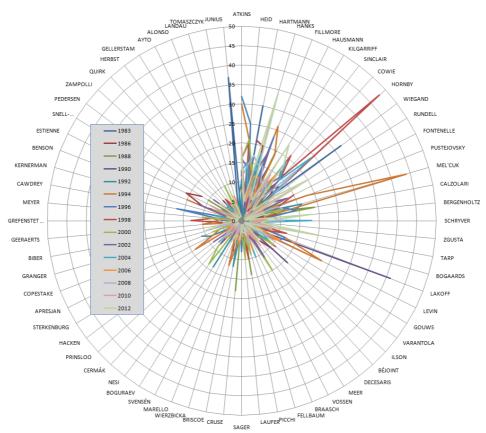

Figure 34: Key scholars and their most significant congress impact(s).

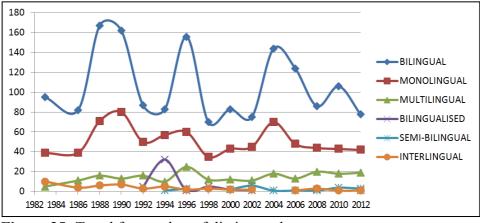

Figure 35: Trend for number of dictionary languages.

Figure 37 tells us that etymological and historical dictionaries receive steady attention, but dialect dictionaries only sporadically.

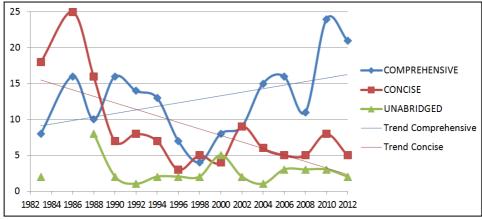

Figure 36: Trend for Comprehensive (and Unabridged) vs. Concise.

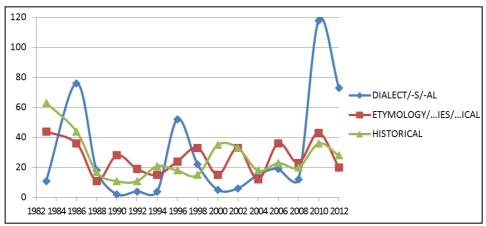

Figure 37: Trend for Dialect, Etymology, and Historical.

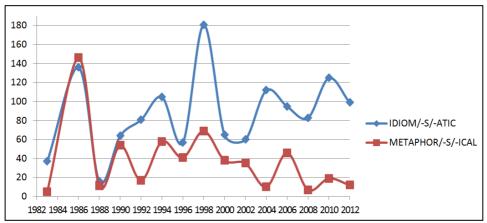

Figure 38: Trend for Idioms vs. Metaphors.

As far as actual dictionary contents go, Figure 38 shows an interesting bifurcation. While idiomatic and metaphorical aspects used to oscillate jointly through time, starting in 1992 idiomatic aspects received ever more attention while metaphorical ones have been on the decline.

With regard to word classes, it is clear from Figure 39 that most attention goes to the verb, followed by the categories noun and adjective. Adverbs and prepositions jostle for fourth position, with pronouns far less prominent. When dealing with verbs, Figure 40 indicates that notions like transitive, intransitive and reflexive are increasingly less important. When dealing with nouns, one may see a change from a focus on singular to plural nouns, as suggested in Figure 41. Going towards morphology in Figures 42 and 43, the attention paid to particles and morphemes, as well as suffixes, prefixes and affixes oscillates widely, with no apparent trends.

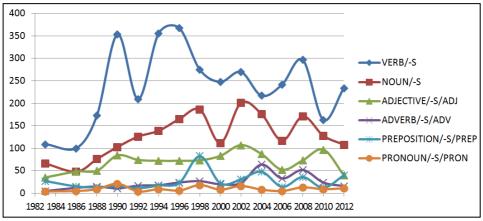

Figure 39: Trend for main parts of speech.

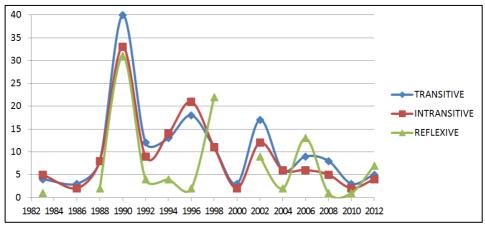

Figure 40: Trend for Transitive, Intransitive, and Reflexive.

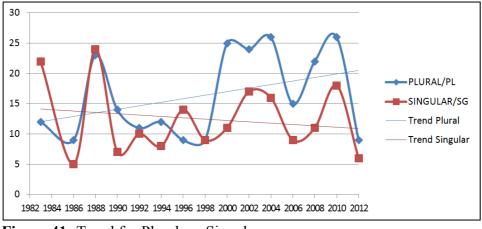

Figure 41: Trend for Plural vs. Singular.

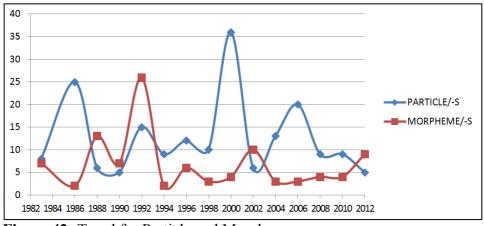

Figure 42: Trend for Particle and Morpheme.

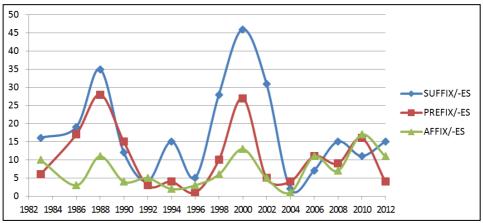

Figure 43: Trend for Suffix, Prefix and Affix.

What about the terms 'theory' and 'practice'? Figure 44 shows that both are healthily in decline, with a worrying upsurge for 'theory' in 2012, as well as in 2000 before that. On closer inspection, however, most of the hits for 'theory' in 2012 stem from Michael Rundell's paper (this volume), who is not immediately known for his strong beliefs in any lexicographic theory. The peak for 2000 is largely the result of a paper by Patrick Hanks (cf. Table 12), but there a 'theory of language performance' is informed *by* lexicography and corpus linguistics.

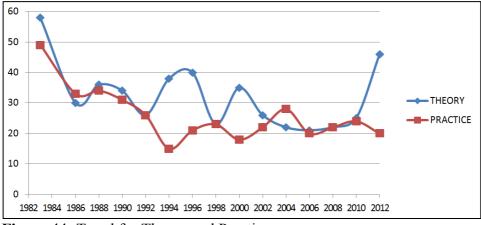

Figure 44: Trend for Theory and Practice.

Any scientific discipline, even one without a theory, needs precise terms. Comparing the trend for 'lemma' with that for 'headword', as done in Figure 45, indicates that the field is professionalising, as the use of the term 'lemma' has recently overtaken the use of the term 'headword'.

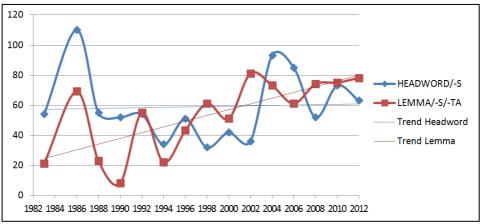

Figure 45: Trend for Headword vs. Lemma.

With regard to the practice of lexicography, while compiling dictionaries ever more attention goes to the varied types of user — a user not confined to the prototypical learner or student. It is not surprising, then, that the occurrence of the term 'user' rises faster than those of 'learner' and 'student', as seen in Figure 46.

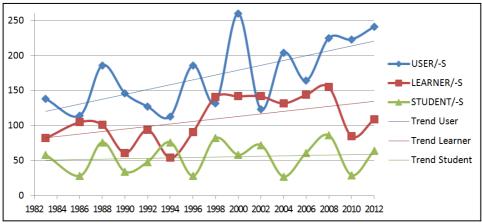

Figure 46: Trend for User, Learner and Student.

Subtle language shifts such as those depicted in Figures 45 and 46 are intriguing, as they are the result of the collective usage of over a thousand scholars, many of whom may not even be aware of the changes they are part of. Another good example is shown in Figure 47, from which one may deduce that 'looking up' in a dictionary is fast being superseded by 'searching' for information — no doubt searching in an *electronic* environment.⁵

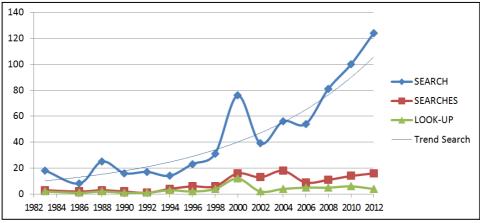

Figure 47: Trend for Search and Searches vs. Look-up.

The shift from looking up to searching is part of a much wider shift, namely that of the arrival of e-lexicography. The road that led to the current state was, however, not as straightforward as one might imagine. Take the mention of computer in the EURALEX proceedings corpus and the computational handling of some tasks, as shown in Figure 48. Except for a spike at the 2000 (Stuttgart) congress, the mention of 'computer' has actually been declining overall. Even the frequency of the terms 'computational' and 'computationally' are mostly back to where they were three decades ago. It is, of course, entirely possible that computers have become such a given that they need not be mentioned anymore. Plus, other related terms *have* been rising steadily, such as 'automatic' and 'semi-automatic', as seen in Figure 49. But then again, also the term 'manual' rose during the same period (albeit not as fast).

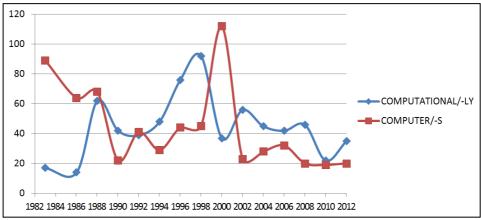

Figure 48: Trend for Computational and Computer.

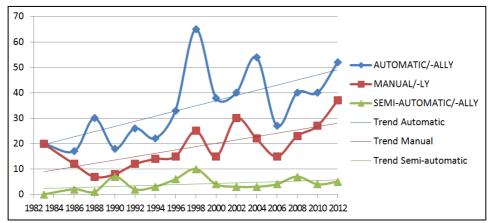

Figure 49: Trend for Automatic, Manual and Semi-automatic.

The corpus road too, was bumpy, as may be seen from Figure 50. Following an exponential growth in their discussion during the mid-1990s, they have since plateaued.

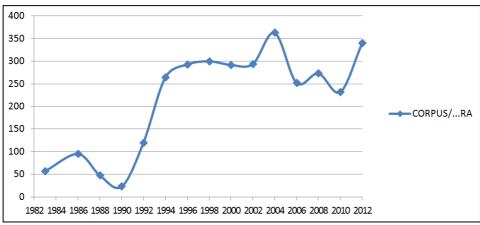

Figure 50: Trend for Corpus.

Likewise for parallel corpora and sub-corpora, whose discussions merely inch forward hesitantly, as seen in Figure 51.

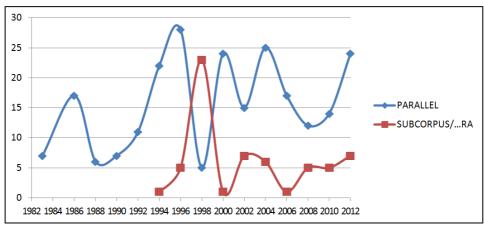

Figure 51: Trend for Parallel and Subcorpus.

Where a clear pattern may be spotted, however, is in the rising use of the term 'corpus-driven' in contrast to 'corpus-based'. Figure 52 suggests that corpus-driven studies and applications are set to overtake the corpus-based ones.

In Figure 53 two popular core components of modern (English) lexicography are contrasted: the BNC and Sketch. The BNC was released

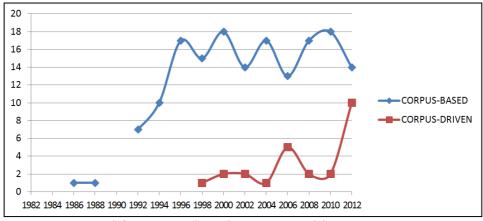

Figure 52: Trend for Corpus-based vs. Corpus-driven.

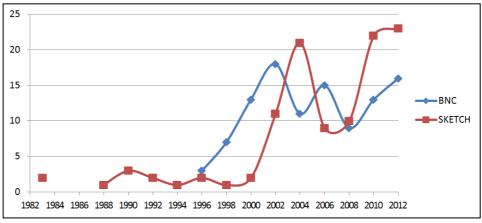

Figure 53: Trend for BNC and Sketch.

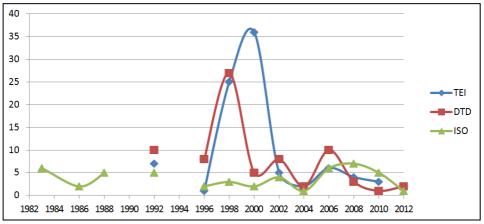

Figure 54: Trend for TEI, DTD and ISO.

in 1995, was first mentioned at EURALEX in 1996, after which it grew and plateaued just like corpora in general (cf. Figure 50). Sketch, here, obviously stands for 'Word Sketch' (first proposed at an ACL workshop in 2001) and the 'Sketch Engine' (made widely known at the 2004 (Lorient) congress, cf. Table 14). It is interesting to note how a tool initially designed to analyse the BNC, became more popular than the raw material itself.

Not all proposals are popular however. Figure 54 lists a few: by and large (European) lexicographers don't like the TEI (Text Encoding Initiative), have shed DTDs (Document Type Definitions), and will not stick to ISO (International Organization for Standardization) guidelines.

Three more trend graphs will be presented. If ever there was a battle between WordNet and FrameNet, Figure 55 suggests that lexicographers have been seesawing between the two theoretical approaches to build semantic networks, with FrameNet currently holding the upper hand. This for the (borrowed) theories.

With regard to the software environments that dictionary compilers work with, Figure 56 suggests a clear line from 'systems' (lexical information systems, knowledge management systems > corpus query systems > dictionary writing systems, dictionary production systems) to simply 'databases' and lots of 'tools' that are combined.

And lastly, from the end user's point of view, Figure 57 tells us that online dictionaries have now properly and finally overtaken dictionaries on paper, in electronic form and of course the antiquated CD-ROMs. (The surge for 'electronic' at the 2000 (Stuttgart) congress is the result of a dedicated AILA symposium on electronic dictionaries in the L2 environment.)

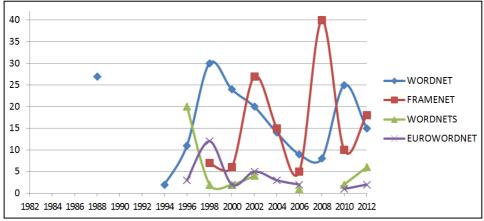

Figure 55: Trend for WordNet, FrameNet, wordnets, and EuroWordNet.

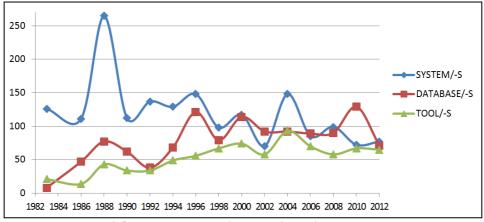

Figure 56: Trend for System, Database and Tool.

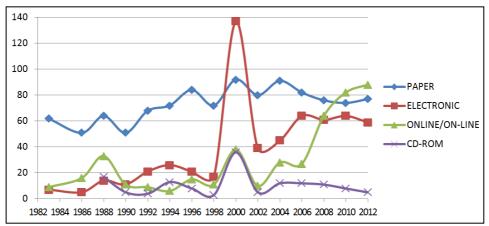

Figure 57: Trend for Paper, Electronic, Online, and CD-ROM.

5. A crystal-clear outlook

Having reviewed the facts and trends in three decades of EURALEX congresses, one would assume that it is easy to now fortune-tell the future. Surprisingly, it is not. Yes lexicography is in transition from a highly traditional art and craft, typically funded by publishers seeking profit from publication in book form, to a new interdisciplinary science in which publishers, software houses, freelancers and university researchers from a variety of disciplines all participate in creating electronic resources for a wide variety of different applications, typically for online use. This is the present. The future will get rid of the book components altogether, and the form the online components will take will be driven by the ever-

faster-evolving technological exploits. Some of this technology will have been conjured up by teams of lexicographers, but in most cases lexicographers will simply jump on the latest 'free' tool offered by a search engine, a social network, or a data-mining team. To the average user 'the dictionary' will simply disappear from view, and drown in a sea of advertisement — customised, of course, amongst others based on the searches in the lexicographic components of whatever tools or networks they use. In order to get rid of the pestering advertisements, users will be able to Go Premium, but Big Brother will still be watching them and continue to build their evolving profile in the cloud. That what we now call lexicographic databases will end up in a variety of social networks is a given. There lexicographic democracy will take its course. Machines, too, will automatically populate lexicographic databases. Stone Age lexicographers will try to compete with these mediocre sources, by painfully analysing unimaginably large amounts of real language data and crafting delicate summaries, mapping meaning onto use, focusing on the norms in order to better describe the exploitations, building frequencysupported patterns for the various word classes, but without a Publishing House, by then called a Marketing House, their efforts will be futile. The future will bring out both the best and the worst of today's lexicographic dreams.

Where will this leave today's academic lexicographers? They will be frantically looking for a theory of lexicography, in order to justify their research position. They will, of course, not succeed, unless they explain the plain obvious in some newly invented language of their own. Or else, if they keep on describing and categorizing what has already been lumped and split a million times before. Calling it a theory does not make it a theory. The smarter colleagues will simply realise that lexicography is a synthetic science, which will need ever more knowledge and (real!) theories from other disciplines in order to move forward scientifically. At congresses, ever more papers will be co-authored (the pressures to publish and be quoted will skyrocket), and each scholar will also be involved in as many papers as possible. PEOPLELEX congresses — or whatever will succeed EURALEX and its sister associations, currently cut up along artificial borders — will be hosted by what is now the periphery, as the current mainstream will come to realize that the lexicographies and solutions of the periphery have far more to contribute.

Lexicography as we know it today will cease to exist, lexicographers will be bringing together their data in entirely new ways, and dictionaries will change beyond all recognition. The times will still be as exciting as today, however, as we will be living in the future.

Endnotes

1 Several words of thanks are due at this point. First to Michael Rundell, who broached the idea, as a EURALEX Board member, to have the EURALEX proceedings scanned and placed online. Second to Geoffrey Williams, who actively supported this project, as Vice-President and President of EURALEX. Third to Simon Krek and his team at Trojina for the actual scanning and OCRing of most earlier proceedings. Fourth to Ruth Fjeld for her willingness to share all the Oslo papers as they came in, making sure the present analysis would be as up-to-date as possible: 'reporting on the fly' so to speak. Fifthly to David Joffe, the main developer of the TshwaneLex lexicographic suite, for his help with the collection of citation data. And lastly, to my father (P. A. de Schryver) and my wife (M. Nabirye) for creating the ideal environment at home, which enabled me to actually set out on this analysis.

2 For the 2010 (Leeuwarden) congress, none reached ten yet, so there the top few are listed rather.

3 Cross-comparing languages could have been envisaged, but will be undertaken in a follow-up study only.

4 When referring to and discussing one another's work, family names are used. Only the best reference lists will also include first names.

5 Search, Searches and Look-up are separate top-1 000 keywords and have been treated as such in Figure 47. The corpus was also queried separately for all verbal forms of 'to look up' and compared to all verbal forms of 'to search'. This revealed an exponential growth for 'to search', compared to hardly any change for 'to look up'. Searching is currently about ten times more frequent than Looking up in lexicographic speak.

Pre-title sequence, as seen and heard during the presentation: About keywords, trendsetters, trends and making an impact

[all photos taken, during the Oslo congress, by G-M de Schryver]

[About Slide 1] You're probably wondering if this is part of the talk — it is. All of you have read the text, so I can actually skip the real talk and do something totally different, which I'm doing. You already know part of the point of the story: I'm analyzing the EURALEX proceedings, trying to look into a ball with all these proceedings in — it's a crystal ball to predict the future. I want to know the road we'll be walking, I want to see the door we're going to, and one of the things at the end, in 55 minutes from now, will be a bunch of new -LEXes (not the ones you've just heard), including MULTILEX. And if ever a picture summarized a thousand words, or in my case a thousand keywords, this is it!

One hundred and twenty years ago, someone else also walked a road, and had this 'vision' that led to this 'painting': *Despair* [Slide 2]. Which then, because he was so obsessed with it, led to what is now

known as The Scream [Slide 3]. He got obsessed with this vision — this is the first painted version of 1893, now in the National Gallery, being juxtaposed with *Despair* [Slide 4] — that it morphed into new versions: This is a lithography from 1895 [Slide 5]. Later, we had a pastel version [Slide 6]: Obviously, one hundred and twenty years later, since Despair, if you count in inflation at one million dollars a year, it is normal that one pays 120 million dollars for a painting. This is the one we saw [Slide 7], all of us, this bright second painted version of 1910, which, as we saw, is part of a collection [Slide 8]. Now, if you start being obsessed with something, and study it, you (a) are setting a trend for yourself, and you (b) hope that you will be taken up: (a) this is yet another variation by Edvard Munch himself [Slide 9], and indeed (b) he is now all over the place [Slide 10]. And then you have clowns every now and then who arrive and think they can 'add' [Slide 11], and they take it so far that they want to be in the real road that led one hundred and twenty years ago to The Scream [Slide 12]. Now, it is good to have one Board Member screaming, but have you ever seen ten lexicographers 'screaming it out'? [Slide 13]

Okay. This was in honour of my good friend Prof Prinsloo, who is a fan of James Bond. And as you know, James Bond always has a sequence before the title page [Slide 14 = title page].

Slide 1: Ilan Kernerman and Judy Ribeck.

Slide 2: Despair, 1892, Thielska Galleriet, Stockholm.

Slide 3: The Scream, 1st painted version, 1893, National Gallery.

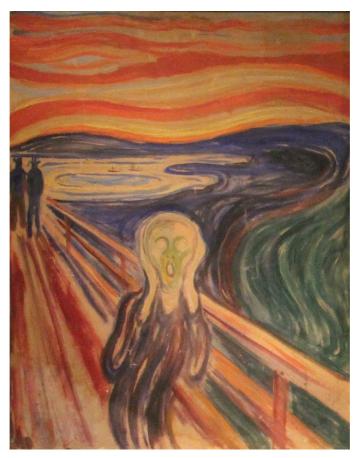

Slide 4: Juxtaposing *Despair* with *The Scream*.

Slide 5: The Scream, lithography, 1895.

Slide 6: The Scream, pastel, 1895, \$119,922,500 (2 May 2012).

Slide 7: The Scream, 2nd painted version, c. 1910, Munch Museum.

Slide 8: *The Scream* with related paintings, Munch Museum.

Slide 9: Angst, woodcut, 1896, Munch Museum.

Slide 10: Pilestredet 30, Oslo.

Slide 11: A clown in the picture.

Slide 12: The clown on the path where Edvard Munch first "sensed a scream passing through nature" — setting a trend.

Slide 13: An entire EURALEX Board 'screaming it out' — having an impact.
